Continuous deodorisation of cocoa butter - by steam distn. in a thin-film evaporator (NL 16.7.79)

FAZER AB 16.01.78-SW-000463

R34 (19.07.79) G11b-03/14

Process comprises homogenising cocoa butter (A) with deionized or distilled water, then continuously passing the homogenate to steam distillation in a thin-film evaporator, to expel water and volatile aromatic components. The deodorised (A) is withdrawn continuously from the evaporator.

Pref. water is 10 ± 1 wt.% on the homogenate and the evaporator operates at steam pressure 2.5 ± 0.5 atmos., 65 ± 15°C and 10-30 mm Hg vacuum.

Used for mfr. of cocoa and chocolate. Material loss is only 0.3% c.f. 1.5% in conventional batchwise methods and since exposure to high temp. is short there is no increase in peroxide no. (the natural antioxidants are not lost). 12.1.79 as 901093 (8pp1251)

Treating milk prods. to reduce the lactose content - using enzymes derived from saccharomyces fragilis

ARIES EMILE SA 21.10.77-FR-031783

(D16) (22.06.79) A23c-09/12

The prods. of low lactose content are prepd. by treating the prod. in the presence of β galactosidase or purified lactase extracted from a strain of Kluyveromyces fragilis yeast of the type Saccharomyces fragilis.

A process as above for hydrolysing 70-90%, esp. 80%, of the lactose from lactoserum comprises eliminating Na and Ca ions, activating with K ions and operating at 40°C and pH 3-6 for 3-6 hrs. The prods. of the 1st process are milk. Condensed milk, yoghurt, and desserts the lactose content of which has been reduced by 40-90% and replaced by galactose and glucose.

The prods. are used in human and animal feeds and the process avoids the problems of intolerance to lactose. Pigs and poultry are able to eat three times more treated lactoserum. 21.10.77 as 031783 (5pp597).

Cotton seed treatment

GASTROCK E A 08.09.76-US-721203
*C03 +P41 (25.07.79) *J53034-937 +A23l-01/20*

Cottonseed kernels are treated by dry comminution of the meats in a manner which minimises the rupture of associated pigment glands. A slurry is formed of the comminuted meats with a solvent for the oil obtd. in the meats, and the meats comminuted in the slurry such that the rupture of pigment glands is minimised.

The resultant slurry is then fed sequentially through a series of ⩾3 cyclones with the underflow of each cyclone (except the last) forming the feed for the next. The overflow of each cyclone subsequent to the first is recycled to the feed of the previous cyclone.

A protein-rich flour concentrate of comminuted meat is recovered from the overflow of the first cyclone. Solids >a predetermined size are sepd. from the first cyclone underflow before being passed to the feed of the second cyclone. Sepd. solids are added to the slurry for comminution. The underflow of the last cyclone is then sepd. into an oil-contg. solvent and a high-gossypol meal. 8.9.77 as 037572 (10pp934).

CRES- ★ D13 54978B/30 ★GB 1549-156

Treating raw potatoes after cold storage - by sequential immersion in three blanching solns. to improve storage quality

CRESTON VALLEY FOOD 03.02.78-GB-004462 (10.05.74-CA-199477)
A92 (25.07.79) A23b-07/14

Raw white potatoes which have been stored at 40-45°F are treated by immersing the peeled potatoes (opt. divided) in an aq. soln. contg. 0.2-4wt.% citric acid (or its Na or K salts) and 0.005-0.8wt.% SO_2 (opt. as Na or K (bi)sulphite or metabisulphite). The soln. has pH 2.3-6.5 and treatment is for 1 min. at 190°F to 5 min. at 110°F.

The potatoes are then immersed in a 0.5 - 1.5 wt.% soln. of Na or K pyrophosphate for 15 sec. at 212°F to 60 sec. at 140°F, and finally in an aq. soln. of 0.05-0.5 wt.% non-toxic alkaline earth metal salt (esp. $CaCl_2$) for 15 sec. at 212°F to 60 sec. at 140°F. Pref. the second soln. contains 0.5-2.5wt.% reducing sugar (esp. glucose) and the third soln. 0.5-8wt.% NaCl or KCl.

Quality for thermal sterilisation and prolonged storage without liq. in flexible containers is improved. Elasticity, firmness and integrity of the potatoes are improved and pieces do not tend to stick together. 3.2.78 as 004462 Add to 1510833 (5pp1251).

Fodder additive for livestock e.g. cattle and sheep - pr
reacting urea with formaldehyde and adding methionine
VAKHSH NITROGEN FER 19.04.76-SU-351496
A97 C03 E16 (A21) (11.09.78) A23k-01/22

Fodder additive is produced by reacting urea with f
dehyde according to the equation $CO(NH_2)_2$ α CH_2O —
$(NH_2)_2$. CHOH.
This process is improved by carrying out the ab
reaction at 110-120 °C and introducing 2.86-fold exc
urea w.r.t. the formaldehyde. Subsequently, meth
is added and the mixt. is cooled to room temp. By
method, product with good mechanical properties a
high nutrient values is obtd.

Storage stable mayonnaise prodn. - using dried milk,
powdered mustard seed, vegetable oil, egg powder, vine
and soda in specified manner
MOSC BR FATS RES (MOFA=) 25.07.77-SU-511404
(11.09.78) A23l-01/24

Mayonnaise is produced by first mixing together dr
ponents in particular dried milk, sugar salt and sod
then adding mustard, a part of water, a part of a ve
oil, egg powder and aq. soln. of vinegar; heating th
paste; cooling; adding the remainder of the vegetabl
and homogenising the resulting coarse emulsion.
By adding mustard to the mixt. in the dry form;
aerating the heated mixt. under vacuum; mixing the
powder with the vinegar soln. and continuing this m
with the cooled paste; and before the homogenisatio
heating again the coarse emulsion, then cooling and
aerating under vacuum. The process is simplified;
bacterial population in the emulsion is reduced, and
stability of the emulsion is improved.

press. vessel mounted on 2 shafts in bearings so that
can pivot about its centre of gravity, has an inlet sect-
n in the form of an oblique truncated zone connected to
cylindrical section with a dished end. A valved outlet
the dished end allows water introduced for the filling
run into a reception vessel attached to the outlet, this
ception vessel being connected by an eration pipe to the
ess. vessel. The valve on the water outlet closes when
e lid of the press. vessel closes and opens when the lid
the press. vessel is open. Alternatively there can
with a water outlet opening and

an aeration opening. Housed inside the vessel and offset from the centre line of the cylindrical section, so that it is directly below the press. vessel inlet/outlet opening, is a lid. This lid is operated by a hydraulic piston and cylinder.

The machine is used for steam peeling of fruits and vegetables, e.g. peaches, tomatoes, cucumbers. Vessel allows the fruits to be introduced in a gentle way so that the flesh is not damaged. Volume of the vessel compared with the amt. of fruit to be peeled is less than in known peelers so that vessel can be pressurised quicker giving better peeling results esp. of soft fruits.

Analysis of total nitrogen content of aq. systems - e.g. sea and river water, by passing inert gas into system and determining gaseous prods.
SUMITOMO CHEMICAL KK 31.01.78-JA-010243 (19.01.78-JA-005066)
J04 R16 (18.07.79) G01n

The analytical determn. of the total nitrogen content in aq. systems involves first passing an inert gas contg. neither nitrogen or CO through (a) a reaction tube contg. a decomposition catalyst, kept at 700-1200°C; (b) a condenser; and (c) a moisture absorption tube.

An aq. sample to be analysed is then injected into the reaction tube, and the gaseous prods. leaving absorption tube (c) are passed into a mass spectrometer to determine the nitrogen content. The signals from the mass spectrometer are then analysed.

Process can be used to analyse aq. systems such as sea or river water and various waste waters. The total nitrogen content is determined with high sensitivity. 18. 1. 79 as 873554 (18pp1319)

Uranium cpds. recovery from waste solns. - obtd. in conversion of ammonium uranyl carbonate during nuclear fuel prepn.
REAKTOR BRENNELEMEN 16.03.78-DT-811559
E31 K05 M25 (16.07.79) B01d C22b

The recovery of uranium cpds. from solns. obtd. during the conversion of ammonium uranyl carbonate, according to parent patent, involves (a) heating the soln. to 95°C, with release of CO_2 and NH_3; (b) adding NH_3, air and H_2O_2 to the degassed soln., with pptn. of the U cpds., at 50-55° C; (c) oxidising the U cpds. by steam into U_3O_8 in an oven at 800°C.

When the soln. to be treated contains nitrates, it is made to flow, immediately after stage (a) of the parent patent, into a pptn. reservoir in which there are crystalline seeds of the pptn. prod. to accelerate the process. The soln. is kept at 50-55°C and measured amts. of HNO_3 and H_2O_2 are added successively, while keeping the pH at 5.6-5.9 by controlled addn. of NH_3. The pptd. U cpds , including derivs. of the disintegration series of U, are stored for about 1 year in a decontamination reservoir. The U cpds. are then converted into U_3O_8.

The solns. are treated so that almost all the final prods are re-useable. 16. 3. 79 as 874886 Add. to 874799 (6pp)

Sludge conditioning system - with heat exchanger stages and inert gas concentration control

VER KESSELWERKE AG 15.06.78-DT-826132
(19.07.79) C02c-03

Sludge, esp. sludge from sewage treatment plant, is conditioned continuously at high temp. and pressure by raising its pressure in several stages. The conditioned sludge pressure is reduced as it passes in reverse order through the same stages and heats the raw sludge by the vapours, released by the pressure relief, to saturation temp. The inert concn. is measured for each stage and is used as the controlled variable for the gas discharge.

This simplifies the control system and minimizes the heat losses. 15.6.78 as 826132(5pp39)

ing plating waste water contg. heavy metal, cyanide etc. - by
act with anion exchange resin to remove metal cyanogen
plex, contacting with cation exchange resin, etc.
URITA WATER IND KK 25.11.77-JA-140705
11 (15.06.79) C02c-05/08

ting waste water is contacted with a weak or medium
ic anion exchange resin to remove metal-cyanogen
nplex ions. The effluent from the first process is con-
ted with a strong acid cation exchange resin to remove
ions. The effluent from the second process is contacted
with OH-type strong basic anion exchange resin alone or a combination OH-type weak or medium basic anion exchange resin and OH-type strong basic anion exchange resin to remove cyanogen ions and other anions.

The ion exchange resin from the first process is contacted with an alkali and a cyanide to elute metal-cyanogen complex ions and then regenerated by a mineral acid. The alkali and cyanide-contg. soln. used for regenerating the ion exchange resin is the regenerating waste water from the regeneration of the ion exchange resins used at the second and third processes.

This method is capable of removing dissolved ions from plating waste water while preventing the deposition of metal-cyanogen complexes. 25.11.77 as 140705 (5pp117)

HAYA/ ★ D15 55372B/30 ★J5 4075-160
Treating organic material-contg., bad odour waste water - with a fermented mixt. of fine brown coal powder, waste grain powder, water and activated sludge
HAYASHI K 28.11.77-JA-141593
C04 (15.06.79) C02c-01/02 C02c-05/10

In treating the waste water, including human waste and waste water discharged from food processing factories, etc. a moist mixt. obtd. by mixing fine brown coal powder, waste grain powder, water and activated sludge obtd. from the aeration tank in a food-mfg. factory waste water treatment plant is fermented at an internal fermentation temp. of >50°C under a solid phase culture condition to give the culture, which is mixed with the moist mixt. to effect refermentation under the same conditions to mfr. a fermented prod. The fermented prod. is then mixed with water to make a paste which is added to waste water to be treated.

Method is effectively and simply treats waste water and also completely deodorises excess sludge which can be used as fertiliser. 28.11.77 as 141593 (6pp117).

Treating waste water contg. organic material - by feeding to tanks arranged in series and adding hydrogen peroxide and ferrous sulphate
TAKI KAGAKU KK 25.11.77-JA-141730
(15.06.79) C02c-05/04

The waste water is introduced in turn, into a series of >3 treatment tanks arranged in series to each of which is added hydrogen peroxide and ferrous sulphate so that the H_2O_2/CODMn molar ratio in each tank is 0.02-1.5 (where CODMn is CODMn concn. in mole in waste water) and also the $FeSO_4/H_2O_2$ molar ratio is 0.1-0.4, and then the flocs and ppte. formed are sepd. and dehydrated, while the supernatant liquor is released to the outside.

Method reduces the amt. of chemicals (hydrogen peroxide and ferrous sulphate) needed, cf. cases in which the chemicals are added to one or two treatment tanks at a time, and also greatly shortens the treatment time.

Method is used to treat sewage, human waste, fibre-processing waste water, dyeing waste water, etc. 25.11.77 as 141730 (3pp117).

ORIO- ★ D15 55374B/30 ★J5 4075-162
Treatment of living waste water - by adding mixt. of carbon, obtd. from pulp mill sludge, and clay to water after aerobic and anaerobic treatments
ORION KIKAI KOGYO 28.11.77-JA-142518
(15.06.79) B01d-15 C02c-05/02

Method comprises adding a mixt. of PS carbon (obtd. by dehydrating, drying and baking at 1000-1100°C pulp mill sludge) with clay in a proportion of 60-50% PS carbon and 40-50% clay to the third stage of the living waste water treatment stages following the first stage in which waste water is treated under aerobic conditions and the second stage in which waste water is treated under anaerobic conditions.

The treatment of the waste water can be carried out very effectively by using very cheap PS carbon. The pulp mill sludge is effectively utilised, and the occurrence of pollution due to PCB is eliminated because PCB is decomposed by heating. 28.11.77 as 142518 (3pp117).

SUMI- ★ D15 55375B/30 ★J5 4075-163
Treating organic waste water with activated sludge - adding 2-chloro: 6-tri-chloromethyl-pyridine as nitrifying inhibitor
SUMIKIN KAKO KK 28.11.77-JA-143141
(15.06.79) C02c-01/06

Organic waste water, e.g. sewage, human wastes, nitrile mfg. waste water or waste water contg. ammonia, ammonium salts, organic nitrogen cpds. is treated by using an activated sludge, but not nitrification, 2-chloro-6-trichloromethylpyridine (I) as a nitrifying inhibitor is added with an emulsifier to waste water, aeration tank, sedimentation basin, or return sludge.

Toxicant action on BOD bacteria can be eliminated and thus the lowering of BOD treatment efficiency can be avoided. The COD and BOD contents in activated sludge treatment liquor can be reduced because the formation of NO_2^- is prevented. Trouble such as the floating of sludge, etc., can be avoided. The treating efficiency can be increased. 28.11.77 as 143141 (4pp117).

KOBM ★ D15 55413B/30 ★J5 4075-444
Preventing corrosion of sea water desalination devices - of multistage flash type, by providing two electrodes, adding the sea water and connecting to DC source
KOBE STEEL KK 28.11.77-JA-143127
J01 M14 (16.06.79) B01d-03/06 C23f-13

The device comprises heat conductive pipes (for guiding the sea water into a heat recovery section, heat radiator and heater) made of Ti or Ti alloy, and pipe plates made of Cu alloy.

The method uses the following steps. An insoluble electrode and reference electrode (both being not electrically shorted with the pipes and pipe plates) are disposed at a section of the device, contacted with the sea water, and connected to a d-c electric source so as to act as anode and cathode, respectively, while the device is operated while keeping the cathode potential at -0.5 to -0.66V. 28.11.77 as 143127 (6pp26).

JAOR ★ D15 55427B/30 ★J5 4075-477
Pure water prodn. using weakly acidic cationic exchange resin - where regenerating waste liquor of strongly acidic resin is passed through weakly acidic resin to convert it to H from
JAPAN ORGANO KK 29.11.77-JA-142265
J01 (16.06.79) B01j-01/09 C02b-01/40

Pure water is produced by passing water to be purified in succession through a weakly acidic cation exchange resin and a strongly acidic cation exchange resin, and passing the outflowed water through a weakly basic anion exchange resin and a strongly basic anion exchanger resin, or through a composite bed of the weakly and strongly basic anion exchange resins.

The improvement comprises passing the regenerating waste liquor of the strongly acidic cation exchange resin through the weakly acidic cation exchange resin to convert to H-form in its regeneration, passing the regenerating waste liquor of the anion exchange resin through the H-type weakly acidic cation exchange resin to carry-out neutralisation of alkali in the regenerating waste liquor by converting a portion of the H-type into alkali metal form, and passing the water to be purified through the partially alkali metal formed H-type weakly acidic cation exchange resin, so that the regenerating agent ratio becomes closer to the theoretical value.

Running costs are lowered, the regenerating efficiency is excellent and the amt. of the resin to be used is lowered, etc. 29.11.77 as 142265 (5pp34).

Organic material contg. effluent water purifier - has bottom support for adsorbent holding truncated cone set coaxially to cylinders
POLYMER ADHESIVE RE 05.07.74-SU-044358
(17.08.78) C02c-05

The compact effluent water purifier with enhanced efficiency has a support attached to the lower bottom for the truncated cone and absorbent. The latter is fitted coaxially to the cylinders, and the central tube discharges through the bottom while its top carries the funnel-shaped strainer in the upper part of the truncated cone. The strainer is surmounted by the spherical cover.

The effluent is fed to the adsorption zone through the strainer, and the clarified water flows out via the funnel and the discharge tube. When the adsorbent is saturated with impurities, the unit is switched to the regeneration regime and the desorbent is fed into the adsorption zone. The eluate is transferred to the catalytic zone to oxidise the organic cpds.

Automatic dispensing of reagent for purifying drinking water or sewage - by using bubbling tube, to register initial liquid pressure head change, piped to covered run/off
MOSC MOSVODOKANALNI 02.07.73-SU-941826
R13 (14.08.78) C05d-27 G01f-01

Liquid reagents can be dispensed automatically by using an open runoff and a covered runoff to divide the flow. For greater accuracy, an initial liquid pressure head change signal, recorded e.g. by a bubbling tube, is transmitted by pipe to the covered runoff, and the reagent flow rate is altered according to the change of this pressure head. This relates the reagent flow to the flow of the initial liquid receiving it. The method is useful in purifying household drinking water or sewage.

Mobile system for cleaning and processing catch basin waste - which carefully controls dilution degree prior to transfer to dewatering truck

LRS RESEARCH LTD 05.07.77-US-812483 (26.07.76-US-709566)
(10.07.79) B01d-21

A catch basin cleaning system for removing liquid, solid and semi-solid wastes comprises a pump for injecting under pressure into the basin to suspend the wastes. An equalisation system receives the waste-contg. liquids and temporarily holds them in a tank. A level sensor determines the waste level and controls the input of liquid into the tank. A dewaterer receives the waste-contg. liquids from the equalisation system and produces liquid and thickened portions. An agitator homogenises the waste-contg. liquids retained in the equalisation tank.

Used for handling of thick, viscous or thixotropic materials, esp. reclamation from storage lagoons of dry, semi-dry or near gelatinous sludge formed as mfg. by-product. Fast, efficient cleaning of the catch basin is effected with min. water addition. The density of clean-pump discharge is maximised and the wash residues are dried to produce a land fillable cake or a thick slurry which is acceptable discharge to a process head or sanitary sewer. 5.7.77 as 812483 Cip 4040960 (12pp1044).

Purification of waste water using rotating trickling filter - comprising elongated, hollow, imperforate shell contg. fixed film contactor media

AUTOTROL CORP 11.10.77-US-840532
(10.07.79) C02c-01/04

A rotating trickling filter comprises a hollow, elongated, imperforate, circular cylindrical shell having a waste water inlet at one end and a treated water outlet at the other end of the shell. A fixed film contactor media is mounted within the shell and spaced from the interior surface. A plurality of spaced channels scoop wastewater from a pool of wastewater in the shell and raise the waste water as the channels ascend. The wastewater is discharged over the media in a trajectory which adds the wt. of the wastewater to the decending media surfaces.

Used in biological treatment of wastewater. There is less hydraulic drag than a rotating biological contactor which requires more power to drive it than the trickling filter. The media is supported and driven at its periphery. Rotation overcomes plugging problems. Each drop of wastewater is exposed to several different surfaces. The open channels provide a very efficient pumping arrangement. Short-circuiting does not occur. 11.10.77 as 840532 (10pp1044).

In the propagation of cells or a virus by introduction of a liquid culture medium and the cells to be cultured into a propagating vessel, the medium is opt. seeded with the virus, and harvesting of the cells or virus from the propagator uses a Koch Static Mixing System (RTM) appts. as the propagator vessel.

Used in the prodn. of cells and vaccines e.g. vaccines against mumps, measles, rubella, Mareks disease, Herpes I and II, influenza, parainfluenza, chicken pox, respiratory diseases, etc. The system allows close control of dissolved oxygen levels, pH etc. and the mixing, culture growth vessel allows a large range of flow rates with close regulation of growth conditions. 23.1.79 as 873653 (15pp395)

MILE ★ D16 54547B/30 ★BE -875-032
Preparing aggregate of bacterial cells esp. streptomyces olivaceus - by contacting with crosslinked cationic polymer prepd. from epihalohydrin and an alkylene poly:amine
MILES LABORATORIES INC 27.03.78-US-890500
A91 (A26) (16.07.79) C12b C12k

The process comprises contacting the bacterial cell mass with a cross-linked reaction product of (1) glutaraldehyde, a cyanuric halide or mixtures of these and (2) a water-sol. cationic polymer prepd. by polymerisation of an epihalohydrin and an alkylene-polyamine of formula: $R_1R_2NRNH_2$, in which R is 2-6C alkylene and R_1 and R_2 are each 1-6C alkyl. In preparing the polymer, the epihalogenohydrin/polyamine mol. ratio is from 0.6:1 to 1.7:1; the polyamine is first reacted with 50-90% of the epihalogenohydrin to attain a substantially-uniform viscosity then the remainder of the epihalogenohydrin is added in portions and a polymerisation temp. of 60-120°C is used. The cellular aggregate is then recovered and opt. dried.

A particular embodiment comprises contacting cells of Streptomyces oliviceus above at pH 8-9 and at pH 8-9 and at 0-30°C for 0.5-1.5 hr. with 4.5-60% by wt. based on the dry cells of the reaction prod. of 12-77% of glutaraldehyde and/or cyanuric trichloride and 23-88% of (2) based on the weights of (1) and (2), at pH 6-10 and at 0-30°C for 0.5-2.5 hrs.

The process is esp. used to prepare immobilised glucose-isomerase enzymes. The aggregate after rehydration has a greater hardness (resistance to compression) than previous aggregates. 22.3.79 as 875032 (18pp597)

Purification of interferon mRNA - by hybridising induced material t CDNA

ANONYMOUS 20.06.79-RD-183009
*B04 (10.07.79) A61k-00/**

Interferon mRNA is purified by taking material induced in cells by known methods and hybridising to cDNA made from the mRNA from non-induced cells.

There is significant enrichment for interferon specific sequences; the purified prod. may be used in the prodn. of double stranded cDNA, which can be inserted into a suitable vector plasmid. Interferon material is useful as an antiviral and anticancer agent, and it is potentially useful as a modulator of the immune system, esp. in tissue graft. (1248)

*(16.08.78) *DL-101-423 C12c-07/14 +B01d-25/04*

Intensified filtration through the bottom of the mesh filter tank in beer prodn. is achieved by increasing the free flow area and by orienting the passages. The unit also reduces the filtration period for the wort with the edges of the holes in the bottom inclined upwards. The angle with the plane of the bottom is 10-40°, and the direction of the slop differs from the centre to the periphery.

The slop in the direction of wort discharge maximises the free area for the liquid and minimises the passage for the mash. This results in small pressure drop while the fluid velocity is kept high.

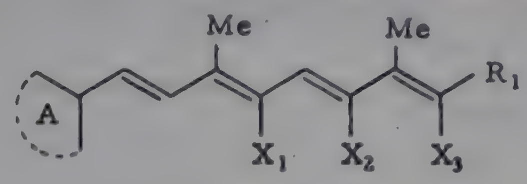
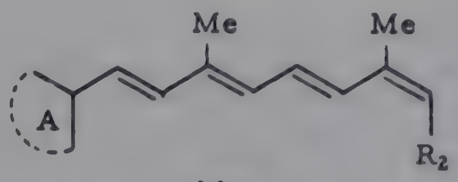
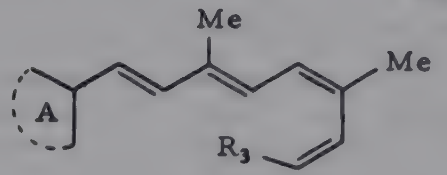
oduction of vitamin/A analogues into respiratory tract - by
luding them in capsules contained in a cigarette
RABAM LTD 07.12.77-US-858295
B05 P15 (B03 B07) (25.07.79) A24b-15/04 A61k-09/72
S: E(BE, CH, DT, FR, GB, LU, NL).
tural or synthetic analogue of vitamin A is introduced
o the mouth and respiratory tract of a smoker by
cating in at least the mouth end of a cigarette having a
tobacco charge a heat or pressure rupturable capsule(s) contg. a vitamin A analogue of formula (I) - (III):



(I)

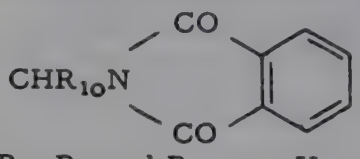


(II)



(III)

(ring A is a 5- or 6-membered mono- or di-unsatd. or aromatic hydrocarbon ring opt. including N or O in the ring and opt. substd. by halogen or lower alkyl, alkoxy, alkoxyalkyl or acyl;
X_1=X_3 are H or one may be halo;
R is CHO, $COOR_1$, R_2OCOR_3, $CONHR_4$, R_5OR_6, R_7NHCOR_8, CHNOH, $CHNNHCOR_9$,



or $COPO_3$;

R_1, R_4 and R_{10} are H or lower alkyl;
R_2 is 1-20 C alkyl;
R_3 and R_5 to R_9 are lower alkyl).

The capsule(s) is ruptured immediately before or during smoking to release the analogue as tiny droplets or an aerosol for exposure to the smoke passing through the cigarette, so that the analogue is carried into the lungs.

The analogue is introduced directly on to the respiratory tract mucosa for treating retinoid deficiencies and for preventing or treating cancers, esp. those caused by the constituents of cigarette smoke. Effective dosages are lower than the high oral dosages needed to achieve the same effects and with which toxic side effects may be observed. Esp. valuable for the treatment of lung cancers.

Microsphere polymer used as filler for cosmetics and pharmaceuticals - produced by UV irradiation of monomer droplets obtd. by cavitation induced by ultrasonic sound
ASAHI CHEMICAL IND KK 28.11.77-JA-141553
A82 B07 G02 (A96 A97 B04) (15.06.79) C08f-02/46 C09d-05

Microsphere polymer is produced by irradiating sprayed monomer droplets with UV rays. The monomer droplets are prepd. by cavitation induced with ultrasonic. Microsphere polymer is useful as a filler for cosmetic and pharmaceutical prods. and as raw material for powder paint.

In an example, a monomer soln. was prepd. by mixing styrene 100, divinylbenzene 10, benzoylperoxide 1, and benzoin 0.5 pts. Monomer spray was formed by ultrasonic energy and then delivered to a zone where UV rays are irradiated. Solidified microsphere polymer was collected by a glass cloth. The sphere was 0.1-1.0μm in dia. The resulting prod. gave smooth feeling to the skin when applied together with vinyl acetate latex. 28.11.77 as 141553 (4pp).

A silicone gel reaction prod. comprises a mixt. contg. an organosiloxane of viscosity 10-10,000 centistokes at 25°C, a liq. hydrogensiloxane of viscosity ⩽10,000 centistokes at 25°C, and a platinum-vinylorganosiloxane catalyst in amt. sufficient to furnish ⩾ 0.1 ppm of platinum w.r.t. wt. of first two components.

Organosiloxane is a copolymer contg. units of formulae $R_2ViSiO_{0.5}$, $RViSiO$, R_2SiO and $MeR_2SiO_{0.5}$, where each R gp is Me or Ph, and Vi is vinyl, such that ⩾ 0.174mol% copolymer units are $R_2ViSiO_{0.5}$ and $RViSiO$. Hydrogensiloxane has formula $XRMeSiO(R_2SiO)n\ (RHSiO)mSiMeRX$, where X is H or R, n and m are each 0, a positive integer or a fraction, and ⩽25 mol.% of R gps are Ph. Catalyst is formed by reacting a platinum halide with a vinyl-contg. organosilicon cpd. in the presence of an organic solvent, plus the subsequent removal of solvent.

Gel can be used in gel pads for orthopaedic use. 13.4.76 as 015013 Add to 1373055 (7pp931).

Bone endoprosthesis is made of ⩾1 net of chemically and biologically inert metal, ⩾1 net of chemically and biologically inert polymeric material, and a binder filling the spaces of the nets. The modulus of elasticity of the composite material is close to that of bone tissue.

In partic, the binder may comprise epoxy resin and a curing agent or polyethylene and graphite filler. Specifically, the elements of each net form parallelogram-shaped meshes with an acute angle of 60°. The elements of the metal and polymeric material nets may be aligned or offset angularly at an angle ⩽10° in parallel planes.

Used esp. for treatment of traumatic lesions of large bones of extremities, and for permanent or temporary replacement of bone defects following an operative removal of osseous neoplasms, in spontaneous osteolysis or after a considerable elongation of extremital bones. Uniform stress distribution between the components of the composite is ensured and its pref. vol. ratio is 1:3-5. The metal is e.g. Ti or its alloy. 16.9.76 as 038431 (12pp945)

Sodium percarbonate particles coated with dehydrated sodium perborate - useful as storage stable bleaching agent
DEUTSCHE GOLD & SILBER 19.03.77-DT-712139 (11.11.76-DT-651442)
*E34 +P42 (19.07.79) *BE-860-762 C01b-15/10 C11d-03/10*

Sodium percarbonate particles comprise a sodium percarbonate core with a coating contg. Na_2SiO_3, sodium perborate of formula $Na_2BO_2 . 3H_2O . H_2O_2$. and other water-binding inert cpds., esp. Na tripolyphosphate, calcined soda and/or sodium percarbonate.

The active O content is pref. 8-15%. Prepn. of these particles comprises wetting percarbonate particles with aq. silicate, followed by treatment with a powdered mixt. of dehydrated perborate and other additives; the process is opt. repeated and excess water is removed. 19.3.77 as 712139 Add to 2651442 (4pp47)

NOVO ★ D25 54864B/30 ★DT 2901-339
Detergent compsn. contg. zeolite - and proteolytic enzyme prepd. by cultivating Bacillus species
NOVO INDUSTRI 17.01.78-GB-001890
(19.07.79) C11d-03/38

Compsn. comprises (a) 1-60 wt.% ⩾1 anionic and/or nonionic surfactant; (b) 0.40 wt.% bleach; (c) 5-80 wt.% washing auxiliary which contains a zeolite, and (d) ⩾1 protealytic enzyme (I). (I) has 80-100% of the max. activity at pH12 as measured by the Anson-haemoglobin method in presence of urea. It is prepd. by aerobic cultivation of an appropriate Bacillus strain on a nutrient medium of pH 9-11 while keeping the medium at pH 7.5-10.5 during the main growth phase.

Pref. compsns. contain 5-45 wt.% surfactant and 10-70 wt.% auxiliary, esp. a 1:2-2:1 mixt. of zeolite and phosphate.

Cleaning effect is equal to compsns. contg. only phosphate as auxiliary but polluting effect is less. The compsns. are suitable for use in relatively hard water, e.g. ⩾20° hardness on the German scale. 15.1.79 as 901339 (19pp1251)

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distingu accepted West German specifications (DAS) from unexamined applications (OLS) which are given the no DT code. in the case of Japan J5 represents unexamined applications, and J7 the examined o present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry

D1: FOOD; FERMENTATION

D11 : BAKING

D11 40252X/22 =DS 2452-100
heated hot air baking oven - with expanded metal flow
der around radial flow fan housing
EFF WERKE GMBH 02.11.74-DT-452100 (00.00.73-DT-307914)
*(26.07.79) *DT2452-100 A21b-01/28*

parent patent describes a gas-fired baking oven with
ir circulated by a fan at the rear of the baking oven.
impeller of the fan is surrounded by a flow grating,
isting of expanded aluminium or steel sheet, with rhom
d openings. The openings are so dimensioned that the
ir flow rate for each opening amounts to 2.4 m^3 per
.

his is a simple way of ensuring that the hot air deliv-
by the impeller is always uniformly directed to the
e plate and the food is browned evenly. 2.11.74 as
00Add to 2307914(6pp39).

E D11 76157Y/43 =DS 2659-027
-fried cooked porous noodles - prepd. by coating wheat flour
salt noodles with oil and emulsifier, steaming and drying
ANEBO KK 05.08.76-JA-093318 (19.04.76-JA-044778)
*(26.07.79) *DT2659-027 A23l-01/16*

ant noodles become edible by treatment with water of
C for 3 minutes. The raw noodles contain a starch com-
ent, esp. wheat flour and 1-6 wt.% NaCl and are treat-
on the surface with an oil-in-water emulsion contg. 2.7-
wt.% water, 0.2-5 wt. % edible oil and 0.01-5 wt.%
lsifier, all percentages based on the wt. of noodles.
noodles are treated with vapour 2-5 minutes at a pres-
e of 0.5-1.5 kg/cm^2 to an α-conversion grade of the
rch of $\geqslant$93% and then dried at $<$ 60 °C. 27.12.76 as
027(14pp068).

JL/ ★ D11 56663B/31 ★GB 2012-548
ezable compsn., cookable to sweet souffle - prepd. by addn. of
fly beaten egg whites to a mixt. of cooked pastry cream and
ooked choux paste
BRULE M R 13.02.79-GB-005006 (14.11.77-GB-047343)
(01.08.79) A23l-01/32

Mixt. consists of a homogeneous blend of 1.2-1.8 vol. of a cooked pastry cream (I), 1 vol. of an uncooked choux paste (II), and 1.2-1.8 vol. of stiffly beaten egg whites (III) (vols. based on vol. of basic liq. of each ingredient).

Baked prods. prepd. from the frozen mixt. above fro excellent light, fluffly baked sweet souffles with good rising props., exceptional stability and maintenance of cell structure, etc. In addn., the foods may be prepd. by unskilled personnel, may be cooked in Al containers, and may be mass produced. 13.2.79 as 005006 (4pp478)

EISA ★ D11 56814B/31 ★J5 4076-8
Quality-improving agent for noodles - prepd. by blending eg
white, fatty acid mono:glyceride and lecithin
EISAI KK 29.11.77-JA-142199
(19.06.79) A23l-01/16

The quality-improving agent is prepd. by combining egg while 0.5-3 pt. wt. (as solid), fatty acid monoglyceride 0.1-3 pt. wt. and lecithin 0.03-0.3 pt. wt. By combining the quality-improving agent 1% in flour the texture, smoothness, glossiness and taste and flavour of noodles (e.g. raw noodle, boiled noodle, fried noodle, dry noodle and instant noodle of Japanese noodle, buckwheat noodle, Chinese noodle, macaroni, spaghetti, etc..) can be improved.

As egg white raw white, freeze-dried white, salted white which is byproduced on preparing lysozyme by IEP-crystallising method and desalted white which is obtd. by de-salting the salted white, can be used. Pref. powdery white obtd. by drying and pulverising is used. Pref. 14 18C fatty acid and soy bean lecithin and yolk lecithin can be used. 29.11.77 as 142199 (4pp5).

D12 : MEAT ; FISH PROCESSING

IC ★ D12 56294B/31 ★BE -873-738
apping for food products esp. sausages - coated with egg
umin and maillard reaction product to give smoke colour
UNION CARBIDE CORP 27.01.78-US-872769
Q32 (26.07.79) B65d C08j

e wrapping particularly one the surface of which, lsp
e interior surface, is coated comprises a coating consi-
ing of an albumin and the reaction product of a reducing
gar and an amino-acid and/or an amino-acid derivative.
e wrapping is prepd by coating the material which is
ef. based on collagen or cellulose. A novel coating co-
psn. comprises a mixture of egg albiumin and the above
action product.

The wrapping is esp. used for sausage type products.
he coating enables a brown smoke colour which is resist-
nt to rubbing unlike the use of the Mailland sugar/amino
cid reaction product alone. 26.1.79 as 873738 Add to
68516 (22pp597)

MHB D12 45743B/25 =DS 2738-845
ppts. for sepg. bone structure from fish - cuts off passable parts
om spine and tail fin SW 26.3.79)
NORDISCH MASCH R BAADER 29.08.77-DT-738845
*(26.07.79) *DT2738-845 A22c-25/16*

A machine to separate the parts of fish skeletons which can be liquored consists of two inclined feed plates which leave a gap between them. This guides the backbone as th skeleton is fed into the machine with the caudal fin first. Two contra-rotating discs overlap the fishbones and their edges guide the backbone on top of both sides to feed the skeleton in the proper alignment to the pair of cutter blades which separate the fishbones from the spine.

This ensures a clean cut and a neat sepn. of parts whic can be liquored. 29.8.77 as 738845(5pp39).

KRAT ★ D12 56439B/31 ★DT 2802-743
Meat band saw - with plastic foam blade cleaning blocks and plastic
scraper lips
BIZERBA-WERKE KRAUT KG 23.01.78-DT-802743
A88 P54 (26.07.79) A22c-17 B23d-55

A meat bandsaw for butchers is kept clean by a block of plastic foam which has been cut parallel to the saw blade and is pressed with the cut surface against the sides of th saw blade. This removes not only bond splinters and coarse particles but also the film of smudge which is caused by the gat content of the meat and would build up as it is not removed by ordinary scrapers.

Specifically the saw blade passes after a first scraper unit with revolving brushes through a second scraper unit with plastic foam inserts. A pref. material is compressible polyurethane foam. Two additional scraper lips with upturned edges contact the saw blade on a bracket with elongated holes. A tray collects the scrapings from the saw blade. 23.1.78 as 802743 (14pp39).

NEST ★ D12 56529B/31 ★DT 2851-908
Aromatising material imparting pork flavour - is prepd. from mixt. contg. aminoacid source, aliphatic mercapto-carboxylic acid or salt and sage oil
NESTLE SA 25.01.78-US-872247
E17 (26.07.79) A23l-01/22

Material for imparting a pork flavour to foods consists of the reaction prod. of a mixt. which is free from added monosaccharide and contains (a) 5-300 pts. wt. aminoacid source, (I), (b) 1pt. wt. lower aliphatic mercaptocarboxylic acid, (II), or its salt and (c) 0.005-0.3 pts. wt. sage oil resin (III).

(I) may be an animal or plant protein hydrolysate. (II) may be 2-mercaptopropionic acid, (IIa), (prefd.), mercaptoacetic-, 3-mercaptopropionic-, mercaptosuccinic- or 3,3,-dithiodipropionic acid, or an Na-, K or NH_4 salt. For gravy flavouring, the mixts. contain esp. 25-300 pts. wt. (I), whereas for flavouring cereals, soya protein extrudate or cold meats, quantity of (I) is esp. 5-200 pts. wt. The mixts. may also contain oil of thyme, celery or cloves or smoked flavour aromatic essence. 30.11.78 as 851908 (17pp200).

TETR ★ D12 56545B/31 ★DT 2901-118
Working up fish raw material for human nutrition - by dividing to fluid condition, sterilising and coagulating, cooling, re-processing and packing (NL 25.7.79)
TETRA PAK DEV SA 23.01.78-SW-000776
(26.07.79) A23b-04 A23l-01/33 A23l-03/16

Worked up, packed food prod. is prepd. by (a) dividing the raw material mechanically and/or chemically to particles having size< 5 (< 1)mm, to achieve a homogeneous, flowable or semi-liq. condition; (b) heating the raw material, during or after it is divided, until it is sterile and the protein components coagulate at least in part; (c) cooling the at least partly coagulated prod. to below coagulation temp., re-processing, homogenising and dividing it up under sterile conditions, until flowable or semi-liq. and (d) packing the sterilised prod. under sterile condieions in packs which are inaccessible to bacteria and in which the prod. can be allowed to thicken to a semi-solid form by means of coagulants, water-absorbing organic cpds. or opt. added materials.

Food for human nutrition can be prepd. from Euphausiacea, shrimps, crabs or thier parts, opt. cleaned fish, fish-cleaning waste esp. from lean, filleted fish mfr. The prod. has good storage properties, esp. heat-stability, good taste, colour, consistency and structure. 12.1.79 as 901118 (20pp200).

TOKA- ★ D12 56817B/31 ★J5 4076-858
Prepn. of conc. protein of Okiami (Krill) - by crushing Krill to paste, coagulating the protein by heating, defatting, dehydrating and drying
TOKAI SUISAN KIKAI 28.11.77-JA-141581
(19.06.79) A23j-01/04 A23l-01/32

Okiami (Krill) is crushed to give paste like material, the paste is heated to coagulate the protein contained in it under thermal modification, whereby there is obtained porous cake of protein having many foamed pores, and then the resultant is subjected to defatting, dehydration and drying.

The process gives Krill protein concentrate. The shell is pref. removed before the present process. The heating may be conducted by boiling, by dipping into boiled water, etc. for 10 - 30 minutes. The defatting process is conducted by repeated treatment of the material with hydrophilic organic solvent. Typical solvents to be used are ethyl alcohol, isopropyl alcohol, etc.. The dehydration and drying may be conducted by heating under hot air, etc. under reduced pressure or normal pressure. 28.11.77 as 141581 (6pp22).

TAKE D12 78732Y/44 =J7
Fibrous protein bundle mfr. - giving good appearance and for use as an artificial meat
TAKEDA CHEMICAL IND KK 19.03.76-JA-030585
*(06.07.79) *J52114-048 A23j-03 +A23l-01/31*

The method comprises adding water to proteinaceou
erial and mixing, heating and extruding the obtd. pl
proteinous lump through a perforated plate in a gase
medium. The novelty comprises using perforated pl
having orifices of different sizes and extruding the p
enious lump first through the small orifices and ther
large orifices, in order. Pref. the dies are compos
several perforated plates placed in order from that
smaller orifices to that of larger orifices in the extr
direction.

The orifice sizes are changed so that the size of
next plate has a cross section of twice that of the for
The starting vegetable protein is e.g. soy bean, and
70% water is added tothe proteinaceous material. Th
trusion is such that the temp. of extruded protein at
exit of the extruder is 145-155°C. Usually 2-5 perfo
plates are used and the orifice size of the first plate
0.005-0.4 mm^2. The form of the perforation is not r
cted and the distance between perforated plates is
19.3.76 as 030585 A23j-3/00 A23d-1/31 (6.7.79)
TAKEDA CHEMICAL IND KK (4pp)(J52114048)

ITAG- D12 19380R/12 =NL-
Poultry plucker with flexible carcass suspension
INT AGRI-SYST INC (INT -) 19.04.67-US-631989
*(16.07.79) *GB1185-803 A22c-21/02*

Feathered carcasses are plucked by means of a seri
rotating cylinders with rounded ends past which the s
ded fowl is transported. The cylinders and their end
equipped with long elastic plucking fingers which re
the feathers and are mounted on either side of the pa
traversed by the fowl but are diagonally placed with r
pect to each other.

The diagonal placement combined with the extra le
of the fingers enables the fowl to pass through the plu
machine with a minimum of damage to the skin or br
of the meat. 17.1.75 as 000564(6pp1370)

SCHN- D12 37878S/22 =NL-
Meat precomminuting machine
FIRMA KARL SCHNELL (GRFJ) 08.03.68-DT-632883
*P41 (16.07.79) *US3580-315 B02c-18/08*

Mincing machine comprises a vessel with cylindrical
and a conical lower section which feeds into the minc
cutter. The conical wall is equipped with precutters
reduce the size of the meat pieces before they enter
mincer. Apart from the main stirrer which is mount
a shaft attached to the lid of the vessel, there is a se
stirrer mounted on a vertical shaft passing through th
bottom of the vessel. This second stirrer causes the
to pass through the precutters a second time thereby
ring that all the lumps of meat are reduced to the cor
size for the mincer and avoiding blockages. 8.10.68
014349(4pp1370).

ELSA/ D12 47077R/26 =NL-16
Apparatus for cutting up meat with sickle- - shaped knives
ELSASSER E (ELS /) 21.12.68-DT-816416
*P62 +P41 (16.07.79) *NL6918-968 +B02c-18/20*

A cutting knife consists of a blade with an approximate
sickle shape of which the outer edge forms the cutting
The outer edge is waved and the alternate peaks are s
-ened from opposite sides.

The blade is used in a cutting tool for cutting meat
sausages etc. The alternating cutting faces extend the
-ful life of the blade between sharpenings and, since t
meat is not continually compressed in one direction at
right angles to the blade during cutting, less heat is ge
rated. Consequently, the quality of the product is not
versely affected by heat during the cutting. The tende
of the blade to mash the meat rather than cut it is also
avoided. 17.12.69 as 018968(6pp1370).

= ★ D12 57634B/31 ★SU -628-869
cal animal stunning unit - with automatic application of
lyte to spring-loaded AC electrode skin contact pressure pads
MPEL RES COMBINE 03.02.77-SU-449983
28.08.78) A22b-03/06

od for electrically stunning animals, as used in hterhouses, veterinary surgery and animal farming, makes use of the effects of an alternating electric cur .

e stunning process is speeded up by applying an elect te directly to the animal's skin at the points where urrent-supplying electrodes make contact.

e animal is herded into a chamber so that it comes ainst spring-loaded electrodes which are firmly pres against its body. The application of the electrolyte is automatically. After 5-10 seconds - to allow suffi- time for the electrolyte to react chemically with the al's skin - the current is switched on. After a pre- mined time the current is switched off and the stunn- imal sent on for further treatment. The time taken e current to act is shortened without damaging the al's hide, and the amount of energy is also reduced.

Plaque inhibiting and removing chewing gum - contg. gum bas
alkyl sulphate, and stearoyl-2 lactylate and/or di-(2-ethylhexyl
sulpho-succinate
GENERAL MILLS INC 28.11.77-US-855511
B05 (17.07.79) A61k-09/68
Chewing gum contains (a) 10-95% by wt. of gum base (I);
and (b) 0.001-25% by wt. of a mixt. of an alkyl sulphate
salt (II) with (i) a stearoyl-2-lactylate salt (III) and/or (ii
a di(2-ethylhexyl)-sulphosuccinate salt (IV). Wt. ratio
(II):(III) or (IV) = 1000:1:1-1000.

The chewing gum is highly effective in inhibiting or r
ducing dental plaque.

Amt. of (II) is 0.001-15%, pref. 0.005-5, esp. 0.01-
by wt. of compsn. In (II), alkyl is 10-18C, pref. even n
Esp. pref. (II) is lauryl sulphate. Wt. ratio (II):(IV) is
pref. 250-1:1-250, esp. 20-1-1-20. Wt. ratio (II):(III) i
pref. 250-1:1-250 esp. 20-1:1-20.

Amt. of (IV) is 0.001-15%, pref. 0.005-5%, esp. 0.0
3%. The combined amt. (II) and (IV) is 0.001-25%, pref.
0.001-10% esp. 0.001-3%.

Amt. of (III) is 0.001-15%, pref. 0.05-5%, esp. 0.01-
3%. The combined amt. (II) and (III) is 0.001-10%, pref.
0.001-3%. Wt. ratio (III)-(IV)=50-1:1-50.

Chewing gums pref. contain 15-70% (I); and also 5-80
pref. 10-70% polyol sugar (esp. xylitol); 1-30% pref. 2-
20% of buffer (esp. $NaHCO_3$); 1-30% pref. 1.5-20% abras
(esp. di-Ca diphosphate. $2H_2O$); 0.01-10% pref. 0.2-5% gl
cerol; 2-99% pref. 5-70%, esp. 10-50% H_2O and/or mono
hydric alcohol (wt. ratio pref. 20-1:1-20, esp. 10-1:1-10

Similar compsns. (mouthwashes, toothpastes, solid
foods, etc.) are also disclosed contg. (II)-(IV) but chew-
ing gums are pref.

Chewing gum was prepd. from (all%) (I) (25), xylitol
(10), $NaHCO_3$ (2), sorbitol (35), 70% sorbitol in H_2O (15),
di-Ca phosphate. $2H_2O$ (5), mannitol (5), glycerol (0.5),
Na lauryl sulphate (0.8), Na-(IV) (0.8), and flavour and
colouring (qs). 28.11.77 as 855511 (7pp478)

Stationary or floating device to remove oil slicks and similar contaminants from the surface of open waters consists of a vessel mounted conveyor. This is either an endless chain with suspended plates or a screw conveyor. The speed of the chain drops from a high speed at the entrance of the plates to a slow speed when they leave to be returned above water level.

The plate spacing becomes smaller and the oil slick thickness great enough for the oil to be removed by pumping. The same effect is achieved by a gradually reduced pitch of the screw conveyor. This allows continuous removal of a floating oil slick, independent of heavy seas or ship movements. 29.5.72 as 226567(11p39).

Filling body for a container for treatment of effluent water comprises a 2-dimensional net-type arrangement of crimped, bonded, synthetic fibres.

One or more ducts pass through the packing which have been formed by moulding. The component filaments of the packing are fused together at their points of intersection. They are suitably made of polypropylene and have dia. of 1-2mm. The packing has a void vol of 80-98% i.e. only 20-2% of its vol. is occupied by fibrous material. 19.1.77 as 702043(8pp267).

LUDE/ ★ D15 56428B/31 ★DT
Containers for sludge collection and thickening - r
transparent material with internal light source
LUDECKE A 23.01.78-DT-802701
(26.07.79) C02c-01/26 C02c-03

Containers for use for the collection and thickenin
sludge in water clarification installations are made
-parent material. A light source can be moved ve
over the whole depth of its contents and valves, ar
at different levels,can be operated to extract the pu
pending on the observations.
The sludge can be drawn off selectively so that t
-er content in the discharge can be minimised. Ca
and operational costs for subsequent stages can thu
saved. 23.1.78 as 802701 (6pp39).

KOST/ ★ D15 56468B/31 ★DT 2
Low cost water filter - comprising fibre mat stretched over b
of partitioned rectangular frame
KOSTER S 24.01.78-DT-802891
J01 P14 (26.07.79) A01k-64/02 B01d-29/16

A filter for the purification of liquids, esp. water f
aria, swimming pools and clarification plants, con
of the filter element and a pump, preferably an air
pump which is inserted in the element. The filter
is a rectangular frame with square subdivisions wh
-vered on the two large sides by filter cloth.
Pref. pump and filter area are matched to produ
flow rate through the filter cloth of 0.05-0.2 cm/m
(0.13-0.17 cm/min). The filter cloth is a 4-10mm
fibre (non-woven) mat.
This is a simple, low-cost filter which requires
maintenance. 24.1.78 as 802891 (10pp39).

erobic biological treatment of sewage on small scale - utilises
ngle sewage inlet into series connected treatment tanks
EFLO INT LTD 27.05.76-GB-022166
(01.08.79) C02c-01/06
ge treatment is effected in a pair of series connected

aeration vessels. Raw sewage is fed into a first vessel a
subjected to bacterial action under aerobic conditions.
Part of the resulting mixed liquor is transferred to the
second vessel and subjected to further bacterial action
under aerobic conditions. Simultaneously, a proportion c
the mixed liquor is recycled to the first vessel.
Transfer of mixed liquor to the second vessel is ceas
and so is aeration in the second vessel to permit settling
in the vessel. The liq. effluent is then drawn off. The pre
ceding process steps are repeated at suitable intervals.
Used as activated sludge process for small scale use,
such as villages, camps and ships, e.g. up to 300 perso
The vessels are in series so that only one inlet for raw
sewage is required. The second vessel is used as an aer
tion tank and as a settling tank and is cheap to build and i
stall. A protection arrangement is used for the inlet of th
effluent tank. Drains are provided for ease of removal of
the built up sludge. 19.5.77 (9pp1044)

**Treating sludge, e.g. from sewage - by adding a fluoride
coagulant, electrolysing to dehydrate, adding calcium-contg. c
and further electrolysing**

KANAI M 05.12.77-JA-145969
L02 (22.06.79) C02c-03

Treatment and utilisation of sludge, partic. sewage
sludge, is claimed in which a fluoride ($\leqslant$ 5% of the
SS content of sludge) and a coagulant (or a bridging
agent), e.g., an iron cpd. or a zinc cpd. (approx. 10
of SS) are added to sludge, and then the sludge is subj
ed to electrolysis for 30 min. - 1 hr. for dehydration,
followed by another $\geqslant$ 30 min. electrolysis by adding 5
of a Ca agent to the sludge and subsequent air drying.

Method provides a fibrous felt-like material by mou
ing the dried sludge into a plate form which can be app
as an elastic paving material for the surface of concre
or the surface of road, playground, etc.. This dried
sludge moulding also, can be utilised as roadbed, sub-
soil, and sound shield for ceiling/floor, etc.. 5.12.77

Treating copper ion-contg. waste e.g. from plating or etching - by adding a palladium contg. activated charcoal to deposit metallic copper
HITACHI KK 07.12.77-JA-146063
E31 M11 (23.06.79) C02c-05/02

Method comprises adding Pd-contg. activated charcoal to deposit the Cu ion on the Pd adsorbed on the activated charcoal, in the form of metal Cu.

In an example, an activated charcoal was immersed in a soln. contg. 500 ml/1 of HCl, 20 g/1 of $PdCl_2$ and 50 g/1 of $SnCl_2$ or a soln. containing 15 g/1 of $AgNO_3$ and 50 g/1 of glutamic acid for 3 to 5 mins. under ordinary temp. followed by water washing. The activated charcoal was charged into a Cu ion-contg. waste liquor which is previously adjusted to pH of 6 - 8 followed by allowing to stand that state until blue colour was discoloured. The water thus treated was outflowed after neutralisation or reused as industrial water. 7.12.77 as 146063 (2pp34).

HITA ★ D15 57195B/31 ★J5 4078-861
Nitrification of ammonia contg. effluent - by removing BOD components and treating with activated sludge under aeration
HITACHI KK 07.12.77-JA-146022
(23.06.79) C02c-01/06

An effluent having nigh NH_4^+-N concn. (100 to 1,000 ppm) e.g. night soil or methane fermentation liquor etc. is subjected to nitrification treatment by (a) previously removing BOD components by sec. treatment and if necessary by the use of activated charcoal to make the BOD/-NH_4^+-N ratio of $\leqslant$ 0.01; and subsequently treating the effluent with an activated sludge while aerating under oxygen transfer rate of 5 tp 30 mMo$_2$/l hr., pH 7 - 9 and load of 1 - 4 kg NH$_4^+$/m^3 day esp. in a tower-type gas-agitation vessel.

Initially suspended solids are increased in the reaction liquor, and settlability of sludge is lowered, but it is formed into flocs which are not destructed under high aeration rate by further treatment. The nitrification of the effluent is carried-out with the flocs thus obtd.. 7.12.77 as 146022 (5pp34).

FJIE ★ D15 57212B/31 ★J5 4079-099
Determination of organic substances in water - by measuring difference in concn. of carbon di:oxide gas in prim. and sec. sample gases using differential and non-dispersing IR analyser
FUJI ELECTRIC MFG KK 06.12.77-JA-146339
R16 (23.06.79) G01n-33/18

Process comprises measuring the difference in the concn. of CO$_2$ gas in (a) a prim. sample gas and that in (b) a sec. sample gas, using a differential and non-dispersing IR CO$_2$ analyser.

Gas (a) is prepd. by vaporising a sample gas with O$_2$-containing gas, pref. O$_2$, by passing it through a prim. heating zone of relatively low temp. pref. 100-150°C, and then converting the inorganic C to CO$_2$; gas (b) is prepd. by burning and oxidising the organic substance in the sample gas or a part of (a) by passing it through a sec. heating zone at high temp. pref. 800-900°C. Gas (a) is passed through a gas passage having delayed characteristics similar to those of the passage through which gas (b) has been passed. 6.12.77 as 146339 (4pp90).

Phosphoric acid recovery from aluminium polishing waste - by addn. of alcohol e.g. methanol, sepn. of aluminium phosphate ppte., then fractional distn.
NITTETSU MINING KK 08.12.77-JA-146561
E36 M14 (23.06.79) C23f-01

Method for recovering phosphoric acid in waste of a chemical polishing liquid for aluminium metal or alloy materials, comprises (1) adding an alcohol to the waste so as to be dissolved mutually with the phosphoric acid therein and to separate the precipitating aluminium phosphate and (2) distilling the sepd. mother liq. to fractionally distil the alcohol while the phosphoric acid is recovered.

The chemical polishing phosphoric acid liquid is ineffective unless the concn. of H$_3$PO$_4$ is > 70%, the waste is generally discharged with H$_3$PO$_4$ concn. > 70%. It is not conc. to crystallise the aluminium phosphate but its viscosity is reduced when e.g. methyl alcohol is added to recover the phosphoric acid in an amt of > 70%. 8.12.77 as 146561 (2pp53).

SATO- ★ D15 57249B/31 ★J5 4079-164
Dehydration of waste sludge to form fertiliser - by addn. of acid to modify sludge, neutralisation with basic cpd. and dehydration
SATO KOGYO KK 07.12.77-JA-146849
C04 (23.06.79) B01d-21/ B01j-01 C02c-03 C05f-07*

Method, comprising (1) modifying and decomposition of the components in the sludge, by addn. of acid (II) to partially dehydrated sludge; (2) neutralisation of sludge with addition of basic compound and (3) dehydration. The sludge can be dehydrated to water content ~50%.

pH of (I) is adjusted to 3 using e.g. HCl, H$_2$SO$_4$ or HNO$_3$. By the addition of acid, components in sludge are modified and/or decomposed and begin to coagulate. As base, slaked lime is pref. used. The cake obtd. is dried to water content about 15% and used as fertiliser. 7.12.77 as 146849 (3pp42).

desalting unit (e.g. for preventing scaling and/or
rrosion of steam turbine boilers) is based upon an out-
column regeneration system using a desalting column,
pg. column, anion resin regenerating column, a mixing
lumn, and a column packed with OH-type strongly basic
ion exchange resin.

In the regenerating cycle, mixed resin in the desalting
lumn is transferred to the sepg. column where the mixt.
sepd. into cation - and anion resin layers. The anion
change resin is then transferred to an anion resin reg-
erating column where the resin is converted to OH type
treating with a stream of caustic alkali soln. Separately,
soln. of alkaline earth metal salt is passed through a
fth column of OH-type strongly basic anion exchange
sin. and the effluent soln. is passed through the regenerated resin bed in the anion resin regenerating column.

The cation exchange resin in the desalting column is regenerated with acid, and then the regenerated anion- and cation resins are transferred to the mixing column, where the resins are mixed together. 4. 7. 74 as 076741 C02b-1/74, B01j-1/09 (9. 7. 79) EBARA INFILCO CO (3pp)(J51005273)

WASU ★ D15 57451B/31 ★SU -628-094
Purification of effluent waters contg. petroleum impurities - by passing the water through filtering layer formed from asbestos fibres, and then applying reverse washing
BAKINO WATER SUPPLY 13.05.75-SU-133820
H05 (24.08.78) B01d-25/10 C02c-05

Purification of aq. effluent contg. petroleum impurities is carried out by forming a filtering layer on a netting. The layer is formed by passing effluent water and an asbestos fibre suspension through the net. Filtering is carried out through the layer and, when the filtering layer becomes clogged, reverse washing is carried out. This method is improved, by conducting the washing from the reverse side using purified effluent water and asbestos fibre suspension. By this method, the purification process can be carried out continuously, as a new filtering layer is formed.

Asbestos fibres having a thickness of 2-3 mm can be used. The purification is very efficient, e.g. when the initial content of petroleum impurities in the effluent water is 9709.3 mg/l., the filtering process reduces the impurities to 9.5 mg/l.; with an initial impurity concn. of 82.8 mg/l., the final concn. is 2.2 mg/l.

Aq. effluent purificn. unit - has cylindrical chamber with axial perforated magnetic to apply magnetic field and oxygen simultaneously
AGRIC PROC HYDROMEC 15.01.75-SU-098204
(24.08.78) C02c-05/04

The effluent purification unit has supply and withdrawal pipelines, cylindrical treatment chamber in which is a manifold for supplying oxygen, plus a settling tank contg. electrodes installed on the pipeline carrying the processed water.

The purificn. effectiveness is increased, as a result of improving the degree of saturation by the oxygen and the intensity with which the impurities precipitate out, by making the walls of the chamber, in which the waste water is treated, from a magnetic material. The manifold supplying the oxygen is disposed along the axis of the chamber in the form of a pipe, on the surface of which, along its entire length, are radial tubes and sprayers. The tubes are displaced relative to one another at an angle and the length increases along the way in which the water moves.

Liq. deaerating appts., esp. for beer making - comprises deoxygenating unit modules and carbon di:oxide metering unit for contacting liq. droplets
MOJONNIER BROS CO 23.01.78-US-871539
(01.08.79) B01d-19

A modular gas-exchange deoxygenating column for removing oxygen-contg. air from a fluid comprises a deoxygenating unit mounted on a liq. exhaust pump bottom unit. A foraminous-bottomed retainer is provided for temporarily retaining a liq. which forms a gas barrier. A basin is mounted below the retainer baffle sheet and stack of the retainer and forms a second gas barrier.

Liq. falling from the retainer and basin are brought into intimate contact with upwardly flowing gas. A metering device introduces CO_2 gas into the column to provide complete exchange of CO_2 for the oxygen-contg. air dissolved in the liq.

Used for removing oxygen from water, esp. in the mfg. and brewing of beer. Construction of the modular column is relatively easy and quick. Thorough mixing of CO_2 with the treated water thoroughly drives out out and oxygen dissolved in the water. The final oxygen content achieved is of the order of one or two pts. per billion pts of water. 20.11.78 as 045210 (7pp1044)

Aspergillus awamori TT-810 - used for producing malt culturing in a medium
TOKYO TANABE KK 02.12.77-JA-143990
(19.06.79) C12d-13/10 C12k-01

Aspergillus awamori TT 810 is new. It is used for producing maltase by culturing in culture medium ar separating out maltase from the culture mixt..

In an example, wheat bran (20 g) and water (20 m were put into a 500 ml volume of Erlenmeyer's flask sterilised with steam at 120°C for 20 minutes, spore suspension of Aspergillus awamori TT 810, previou cultured on potate dextrose agar-agar streak culture ium at 30°C for seven days, was inoculated and cultu at 30°C for five days. Culture mixt. contained in ten flasks were joined into one, 2 L of water was added blended well and extracted at 5°C for a night. Maltas potency of the filtrate was 128 units/ml (1280 units/g wheat bran). Equal volume of acetone was added to 1 of the filtrate at $< 10°C$, ppte. was recovered by ce rifugal sepn. dried under reduced pressure to give 1 g of crude maltase powder. Maltase potency per 1 m the powder was 15.6 units. 2.12.77 as 143990 (7pp69

Prepn. of frozen material contg. luminous bacteria - by fr luminous bacteria in aq. soln. contg. poly:hydric alcol aminoacid
MITSUI TOATSU CHEM INC 28.11.77-JA-141684
(19.06.79) C12k-01/08

The method comprises freezing luminous bacteria in aq. soln. contg. polyhydric alcohol or amino acid. The luminous bacteria can be stored for a long period without decrease in luminous activity. The polyhydri alcohol includes erythritol, glucose, glycerin, sucros sorbitol, etc.. The amino acid includes threonin etc. In an example luminous bacteria, such as Photobacter phosphorium, is cultivated in a medium clntg. meat e tract, polypeptone, glycerin , table salt, etc. of pH 6 at 5 - 35°C at 10 - 20°C for 12 - 48 hours under aero conditions, and then the cultured cell bodies are colle and suspended in an aq. soln. contg. polyhydric alcoh or amino acid, followed by freezing. The amt. of ami acid is 0.1 - 5% and that of polyhydric alcohol is 1 - 2 28.11.77 as 141684 (2pp22).

Cultivation of Chlorella - using distilled residue of alc beverage prodn. from grain, waste fermentation material carbon di:oxide, under light
SUN GRAIN KK 01.12.77-JA-144710
(19.06.79) C02c-01/02 C12k-01

Chlorella is cultivated in a culture medium which com ses waste carbon dioxide obtained in preparation of di ed alcoholic beverage using grain as starting materia distilled residue and waste liq. of factory under radia of sunlight.

In an example, in a vessel are charged 20 litres of illed residue of whisky, 10 litres of fractionation resi of whisky, 10 litres of waste liq. from factory which produced using microorganisms, 0.04 kg of distilled centrate thereof, 6 g ammonium nitrate, and sodium droxide to adjust pH to 6.5. Chlorella is cultivated in this vessel under introduction of air contg. CO_2 at a r of 8 litres/min. and under radiation of fluorescent lig at 30°C for 48 hours.

Chlorella can thus be obtd. in high yield using wast materials as culture medium. 1.12.77 as 144710 (3p

Fixing enzymes - by blending sorbitan fatty acid ester hydrocarbon oil and emulsifying prod. with aq. soln. of enzyme
AJINOMOTO KK 02.12.77-JA-144821
B04 (19.06.79) C07g-07/02

Sorbitan fatty acid ester is added to hydrocarbon oil, f owed by blending, and to the oil phase of the resultant added aq. soln. of enzyme, followed by agitation to give an enzyme-contg. emulsion. By this method, enzy can be fixed at high yield.

example, 1.0 g fluidising paraffin is mixed with
f sorbitan oleic acid monoester, followed by
n with the use of magnetic stirrer. To this soln.
vise added 1. 0 ml of aminoacylase aq. soln.,
l by agitation for 10 minutes. To the resulting
n is added 0.3 g acetyl-D, L-methionine and agit-
conducted at 25°C for 20 minutes to allow an en-
eaction to proceed. Ten ml of water is added to the
nt and agitation is conducted at 700 rpm for 1.0
nd the produced L-methionine is extracted. Yield
ethionine is 50%, and fixing rate of the enzyme is
12.77 as 144821 (3pp22).

Faster union of bone fragments is ensured by injection of proteolytic ferment. The adhesion of fragments during the stabilisation period ensures formation of bone tissue already after 27 days, as shown by X-rays.

Spongy structure is observable after 49 days, and complete consolidation is achieved in 4 months instead of 6.5 months when using conventional therapy.

Extractor for raw materials of vegetable origin - has perforated
plates on vertical reciprocating rod surrounded by close vessels for
improved filtration used in alcoholic drink etc. mfr.
KIEV FOOD IND INST 01.08.76-SU-389232
(08.09.78) B01d-11/02

Extraction device, for treatment of vegetable raw materials used in the liqueur-vodka industry, comprising a column contg. perforated plates one above the other fastened to a rod connected to a drive which ensures an upwards/downwards reciprocating movement.

The extraction process is intensified and the consumption of energy is reduced by creating alternating filtration zones, which allows the extracting agent to pass through a constantly regenerated layer of raw material. This is done by installing a cylinder coaxially inside the column and fitting vessels one under the other firmly inside the cylinder. The number corresponds to the number of plates. Each plate is thus placed inside a vessel at the level of one of its edges with a gap smaller than the size of the perforations in the plate. Where the density of the raw material is less than that of the extractant the plate is located at the upper level of the vessel; if it is greater, the plate is mounted at the lower edge. So that the raw material can move along the column, the plates are made conical.

Microorganisms culture unit - has hollow helical tips with angled flat nozzles ejecting air

N CAUCASUS PROTEIN (KDPO=) 05.05.76-SU-357595

(30.08.78) C12b-01/10

Improved air distribution in the microorganisms culture unit and intensified mass exchange between air and culture fluid are ensured by flat nozzles. The latter are made by holes in the helical attachments. The outside edges of the holes are set at an angle of 5-10° with respect to the surface of the helical attachment.

The culture fluid is picked up by the stirrer and forced towards the hollow helical attachments whose holes eject air. This ensures saturation of fluid with air required for the yeast.

Microorganisms culture unit - has uniformly distributed circulation pipes with top funnels beneath headers

MOSCOW CHEM EQUIP INST 02.09.76-SU-400971

(30.08.78) C12b-01/10

Intensified foam breaking ensuring higher efficiency of the microorganisms culture unit is due to circulation pipes uniformly distributed over the cross section of the tank. The pipes carry funnels at the top, and the foam breaker is made up of headers mounted over each of the funnels.

The foam is produced during aeration of the medium, and the vertical circulation is controlled by the airlift set between the circulation pipes and the down-flow of fluid in the pipes.

Chekhov O.S., Vetoshkin A.G., Kutepov A.M. et al. Bul. 39/25.10.78 2.9.76 as 400971 (4pp89)

USPI= ★ D16 57778B/31 ★SU -629-227

Microorganisms culture unit - has a perforated helical insert on shaft with upwardly increasing diameter and holes size

UKR SPIRITS LIQUOR 01.04.77-SU-470149

(30.08.78) C12b-01/10

Intensified growth of microorganisms is achieved by using the insert fastened to the shaft having dia. of successive turns of flight and its holes increasing in upward direction. The perimeter of the perforated helical insert features a downward serrated flange.

The aeration air fed below the fluid surface gives rise to a buoyant force decomposed by the helical surface. The horizontal component of the force turns the shaft and thus the culture liquid is subjected to rotational movement. The interaction with air bubbles along the vertical path results in intensive mixing and provides a high-effic mass exchange.

Bacterial culture process - using bacterium with temperature-dependent plasmid replication
MOLIN S (UHLI/) 30.12.77-DT-759053
*B04 (26.07.79) *DT2759-053 C12k-01/02*
D/S: N(BR, DK, JA, SU).

Prodn. of gene prods. is carried out by (a) obtaining a bacterium contg. a plasmid which has a controlled copy no. (no. of copies per cell) at one temp. (T_1) but has a much higher or completely uncontrolled ('runaway') copy no. at a different temp. (T_2); (b) culturing the bacterium under conditions such that the temp. is equal or close to T_2 for at least a predetermined time; and (c) isolating the gene prod. from the culture.

The process can be used to produce polypeptides or proteins, e.g. enzymes, hormones, or antigens.

The temp-dependent copy no. can be utilised, e.g., in cases where the prod. inhibits bacterial growth; in this case, the bacterium is cultured at T_1 until a large stock of cells has been produced, after which the temp. is changed to T_2 to maximise the prod. yield.

Continuous centrifuge for sugar prodn. - having flat plate at top of rotating basket over which sepd. solids pass being sprayed on by fresh slurrying liq. to form new slurry
BRAUNSCHWEIG MASCH 25.01.78-DT-803160
P41 (26.07.79) B04b-07/04 B04b-15/12

Continuous centifuge for reslurrying sugar extract masses consists of a conical basket which is rotated and into which the feed is fed at the base liq. in the feed passes out through the mesh of the basket while the solids travel up.

Round the upper rim of the basket is a flat circular plate, over which the centifuged solids must pass. Mounted over this is a spray for the liquor to form a new slurry. The solids and liquid are ejected against a plate at 45° to horizontal. This causes some residence time and good mixing before the slurry drops and is passed on to the next stage of the process.

Used in sugar prodn. the arrangement allows successive extraction and processing by reslurrying the solids before they leave the machine. 25.1.78 as 803160 (14pp1053).

Sugar cubes mfr. - by compression in slots in a rotating cylindrical drum
ELBA MAC FAB BV 20.04.76-NL-004172
*+P71 (16.07.79) *NL7604-172 C13f-03/02*

Sugar cubes are mufd in a device comprising a drum which rotates about a horizantal axis, the walls of which contain slots which receive the granular sugar and serve as forms for the compression into cubes. On the inside of the drum and aligned with each slot, there is a plunger operated by a cam and follower mechanism. The slots pass under a feed hopper and are filled with sugar, the sugar is then compressed by means of the plungers working against a counter surface held against the outersurface of the drum during the compression and the cubes are then pushed out of the slots onto a receiving conveyor.

The slots pass through a cleaning zone before they pass back under the hopper. In order to elimeinate the complicated control mechanism for the countersurface during the compression stage, the surface is attached to a spring loaded arm which pushes the surface against that of the drum but, at the other end is hinge mounted to a spring loaded passive piston. The frictional force due to the contact between the two surfaces carries the countersurface around the drum until, at a certain angle the support arm withdraws and the surface returns to the start position. 20.4.76 as 004172(4pp1370).

Sepg. solid particles from fats, esp. in fractional crystallisation - using uniform agitation until agglomeration takes place
LEVER BROS CO 08.01.76-GB-000651
*(17.07.79) *BE-850-088 C11b-03 + C09f-05/10*

Fatty material is fractionated by cooling the fatty material from a wholly liq. condition in a cooling zone to a temp. at which partial crystallisation of the fatty material takes place, while aggomeration of crystals resulting from homogeneous agitation occurs in the cooling zone. Fat crystals formed are then separated out from the remaining liq. fatty material.

Cooling zone is defined between the inner walls of a chamber and a stirrer having a smooth profile mounted in the chamber. Pref. homogeneous agitation is provided by a cylindrical stirrer concentric with the chamber.

Heavy crops of crystal fractions can be separated contg ⩽ 35 wt.% solids. Esp. used for the prepn. of margarine fats from vegetable fats, which may be hardened before or after fractionation. 28.3.78 as 890888 (+4.1.77-US-756687) (4pp931)

**Sodium dichloro isocyanurate dihydrate prepn - by
anhydrous sodium dichloro isocyanurate with a hydrated salt**

FMC CORP 18.07.73-US-380459

*E34 (14.09.78) *BE-817-721 C07d-251/36 +C11d-07/54*

Sodium dichloroisocyanurate (I) dihydrate is prepare
mixing (I) contg. 11% water of hydration with not m
than a stoichiometric amt. of hydrated salt (II) whic
verts (I) to its dihydrate, heating to ambient - 70 °C
50 °C) to initiate and complete exothermic reaction a
covering a mixture of hydrated (I) contg. 11-14.1 wt
water, and the residue of (II). The process limits
content to a min. and provides a free flowing stable
uct with long storage life suitable for use as a bleac
detergent formulations. It is resistant to thermal d
osition.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distingu accepted West German specifications (DAS) fron unexamined applications (OLS) which are given the n DT code. in the case of Japan J5 represents unexamined applications, and J7 the examined o present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

Q36 (02.08.79) *BE-825-992 B65h-54/04

stallation for winding wire, strip, etc. on to a reel,
comes the problems arising from guides laying in at
stant angle. With these, at the point of reversal, the
rial jumps away and the new layer is only commenced
a gap equal to a number of coils, to that the capacity
e reel is not used to the full, and the stability of the
ng is in doubt.

oth the reel and the material being wound carry out
iable displacement motion relatively to each other
arallel to the axis of the reel. A control circuit is
ided which regulates the displacement speed dependent
the position of the material and the angle at which it is
ing on to the reel. The control circuit embraces a
arrangement for regulating the feeding angle of the
rial, a second arrangement for regulating the speed
e relative displacement between guide and reel, so
the running on angle is variable to the value zero or
s desired value.

third arrangement influences the first and second
ngements dependent upon the progress of winding.
, in a definite zone of the winding on, the running on
e can be regulated at its desired figure and in at least
other definite zone of the winding on, the running on
e can be altered to zero or to its desired value.

F/ ★ D11 58285B/32 ★DT 2804-033
erbread spreading machine - with shallow concave openings
rum periphery for applying dough on wafers
VOLFEL P 31.01.78-DT-804033
(02.08.79) A21c-09/04

wafers in the mfr.
of spiced honey cake (Lebkuchen) includes a drum with several opeings on the periphery to accept a wafer. On passing a dough funnel under pressure the concave space over the wafer is filled with dough.

The capacity of this machine can be increased by arranging severl lines of openings on a wide drum. It is easier to clean than a plate chain design. 31.1.78 as 804033(14pp)

HEBE- D11 52418Y/30 =GB 1550-232
Plates for baking clamps, esp. for waffles - which are self-supporting, transfer heat uniformly and are easily handled
HEBENSTREIT GMBH 06.05.76-DT-620109
(08.08.79) *DS2620-109 A21b-05

A baking plate for baking tongs for the production of cakes has recesses in the outer heat input side which taper towards the paste treatment side of the plate. The surface area of the outer side is greater than the inner.

Pref. the recesses are symmetrical to the centre line of the baking plate in a cobweb-like array. Alternatively the recesses can be arranged in lines. The recesses all have a frusto-conical or a pyramidal shape. The taper angle is 7.5° to 22.5°.

The heat economy is improved. 17.1.77 as 001705 (9pp1376)

CONF= ★ D11 ✓ 59373B/32 ★SU -629-911
Dough for baking protein-rich sweet pastries - includes addn. of protein components and starch soln. stabilised with sodium alginate
CONFECTIONERY IND (HETO) 08.06.77-SU-496048
(12.09.78) A21d-13/08

The emulsion is prepd. from sugar powder, inverted syrup, condensed milk, melange, salt, soda, ammonium carbonate, water and melted margarine (at 42°C). Separetely, an alginate-starch gel is prepd. by solubilisation of one half of the total amt. of starch in a 0.9-1.2% sodium alginate soln. at 68°C. Then, the remaining half of the starch is admixed to the above emulsion, followed by the above gel and proteins in an amt. of 10-15% w.r.t. the total compsn.

The mixt. is kneaded at 30°C. for 2 min., and baked. Shulga, L.F., Antokolskaya, M.Ya., Tolstoguzov, V.B. et al. Bul. 40/30.10.78. 8.6.77 as 496048 (3pp70)

MRSC ★ D11 59767B/32 ★US 4162-333
Filled food product manufacture - in which extruded dough tubes are internally supported during baking prior to filling
MARS INC 03.08.78-US-930757
(24.07.79) A21c-03/04 A21c-09/06 A21d-08/02

Food articles having a tubular body of baked dough and a soft filling of e.g. cheese, are made by extruding tubular dough lengths onto upstanding pins carried by a conveyor, passing the lengths still on the pins through prooving and baking stations, removing the lengths from the pins and finally filling the removed lengths with the filling.

Pref. the pins are carried by separate plates which are moved through the various stations by several conveyors in series, whilst in another embodiment the pins are carried by a single wire mesh conveyor which moves the pins through all the stations.

The pins support the dough lengths and ensure a regular shape to the articles. 3.8.78 as 930757 (9pp525).

ALFR- ★ D11 59768B/32 ★US 4162-334
Bread baking in earthenware pans - coated with terra sigillata to prevent adhesion
ALFRED UNIV RES FOU 21.08.78-US-935663 (27.04.77-US-791507)
L02 (24.07.79) A21d-08/06

Bread is baked in a fired brickware pan having a water permeability of ≥ 2% and a coating, at least on the baking surfaces, of fired terra sigillata. The coating closes only some of the pores in the earthenware body, so that it still imparts the characteristic taste and physical properties of brick oven baked bread, but the bread does not stick to the pan.

The earthenware body has a permeability of 2-12% and the coating closes 30-95 (30-60)% of the pores. 21. 8. 78 as 935663 (6pp955).

D12 : MEAT ; FISH PROCESSING

QUAK ★ D12 58003B/32 ★BE -873-617
Extruded foods esp. meat products for pet foods - using modified extruder conditions to obtain greater throughput
QUAKER OATS CO 19.06.78-US-917322
C03 P28 (23.07.79) A23p A47j

The process comprises (a) forming a thermoplastic paste contg. sufficient water and of the desired viscosity, (b) extruding the paste in an extruder, (c) injecting sufficient steam into the extruder prod. when it leaves the extruder, (d) mixing the steam and prod. to condense at least part of the steam and distributing the water uniformly in the prod. thereby raising the temp. and water-content (e) shaping and recovering the product.

A shaped prod. formed from a paste comprises 14-40% protein on a dry basis derived from at least one protein source, 1-45% of at least one starchy ingredient, 15-50% water equal to at least the paste water-content, together with nutrient and appearance additives and a stabilising system. 22. 1. 79 as 873617 (23pp597)

WINK/ ★ D12 58111B/32 ★DL -135-681
Fish transporting device - with return drums of parallel endless belts swinging eccentrically
WINKLER O 04.04.78-DL-204575
(23.05.79) A22c-25/08

A device to feed fish into fish processing machines uses two endless belt conveyors with pulleys on vertical axes between which the fish is moved forward. The drive pulleys can turn around their shafts and the return pulleys can swivel on circular arcs from a centre, offset from the centre of the drive shaft.

This causes the conveyor belts to exert a constant pressure against the fish sides without requiring springs or other technical facilities. 4.4.78 as 204575 (6pp39)

SPRA/ ★ D12 58156B/32 ★DL -135-798
Fish loading device for processing machines - with sensor for size dependent discharge
SPRANGER H 20.04.78-DL-204910
(30.05.79) A22c-25/08

An automatic device to feed fish to processing machines at a level depending on the fish size, a feeler responds to the fish height and adjusts by a linkage a wedge. The wedge governs the displacement for the delivery end of a fish conveyor which is actuated by a power cylinder.

The fish is not exposed to any stress which may cause damage. The device is entirely automatic and needs no attendance, once a wedge has been selected to suit the type of fish. 20.4.78 as 204910 (7pp39)

HUCK- ★ D12 58216B/32 ★DT 2803-361
Woven sausage skin - with warp and weft threads at angle to longitudinal and peripheral direction
HUCKFELDT & THORLIC 26.01.78-DT-803361
F07 (02.08.79) A22c-13

A woven sausage skin is made from a woven strip with diagonal weft and warp threads which include pref. an angle of 90° and include rhombs with a ratio of the diagonals of 1 : 1. When the edges have been sewn together to form a hose and the sausage meat is filled in, the hose is stretched to 1.27 times its old diameter and the diagonal ratio os 2 : 1.

The woven skin can be produced economically and can be stored on the tubes of sausage machines in much greater quantities than woven skins with longitudinal and equat-

STEN- ★ D12 58235B/32 ★DT 28
Sausage loop presentation device - with feeding flight, cutte
and flexible pusher
FA STENZEL P 27.01.78-DT-803511
(02.08.79) A22c-11/12

A device to present suspension loops to a sausage fill
machine contains a reel with a wound strand of loops
which is unwound and pulled along a groove by a fligh
Locating plungers hold the strand as a cutter balde cu
off a certain length and a flexible pusher moves the l
along a guide tube to the sausage filling machine.

This requires no manual intervention and automati
presents the suspension loops to the sausage filling m
ine. 27. 1. 78 as 803511(12pp39)

FREI- ★ D12 58279B/32 ★DT 280
Meat carcass suspension rail conveyor junction - has two
tongues with setting device for connection with either branch
FREITAG L TRANSPORT 31.01.78-DT-804005
Q21 Q41 (02.08.79) B611-05 E01b-25/26

The junction points are for conveyor layouts with susp
sion tracks, esp. sliding tracks for large pieces of m
with one rail as approach and two or more for selecti
runoff, and movable points tongue connected with a se
unit. Here there is a second points tongue (11). Both t
gues (11, 12) are activated simultaneously with one se
unit (8).

In each locking position one tongue only provides co
ection between the approach and the appropriate runoff
The tongues may have different configurations, both be
mounted on a sliding carriage for the setting unit. Thi
obviates need for hinge joints subject to damage or req
ring constant maintenance. 31. 1. 78 as 804005(16pp568

HENN/ ★ D12 58299B/32 ★DT 2804
Meat e.g. sausage treatment with smoking spice colour soln.
immersion or sprinkling to prevent benzopyrene collection
surface
HENNING W 01.02.78-DT-804184
E14 (02.08.79) A23b-04/14

Surfaces of meats are treated, cold or warm, by quick
immersion or insertion in- or by quick sprinkling with
a meat-smoking spice colour soln. contg. smoked aron
atisers, finely ground brown, reddish/brown, yellowis
brown foods, spices and/or food additives and water.

The smoking spice colour soln. is pref. prepd. by s
king the water-soluble foods and/or additives so that th
soln. contains only 8-15 µg benzy(a)pyrene/kg.

The collection of water-insoluble benzopyrene-contg
polycyclic hodrocarbons on meat surface and enviromen
tal pollution by smoking-pyrolysis are prevented. Benz
pyrene concn. on meat surface can be limited to 0.3-0.
µg/m^2. Taste and aroma are good. 1.2.78 as 804184(

STRE- ★ D12 58301B/32 ★DT 2804-
Hot dogs in brine - packed in plastic bags by lowering hose f
filler tube and applying clips after filling
STREITER F KG 01.02.78-DT-804191
Q31 (02.08.79) B65b-09/10

Bags containing hot-dogs in brine are produced by gathering a plastic hose over a vertical filler tube, closing
bottom end and lowering a group of hot dogs in it. After
pouring in brine, the bag is closed on top and severed.

This is a cheaper way of packing hot dogs than tins.
The transparent bag attracts customers and the

D12 58327B/32 ★DT 2843-624
illing machine - with one swivelling cylinder in filling and ischarging station
OMBINAT NAGEMA 27.01.78-DL-203439

Prepn. of butter flavour - by mixing oil, fat, skimmed milk sol
water and decomposing with lipase, protease and/or lactase

NIPPON OILS & FATS KK 06.12.77-JA-145701

(27.06.79) A23l-01/22

The method comprises combining oil and fat 10-60 w
skimmed milk solid 5-35 w/w% and water 30-80 w/w
and decomposing the mixt. with lipase, protease and/
lactase.

As oil and fat beef tallow, butter oil and eater-exc
nge oil can be used singly or together and among them
pure butter oil and the ester-exchange oil obtd. by es
exchanging the mixt. consisting of tallow 83.8%, trim
stin 6.5%, trilaurin 1.5%, tricaprin 1.8%, tricapryl
tricapron 1.5% and tributyrin 4.0%, can be used favou
ably. As lipase that obtd. from the microbes of Asper
llus, Rhizopus and Mucor and animals such as infant
eep, calf, pig, etc. can be used. As protease that obt
from the microbes of Aspergillus, Rhizopus, Strepto
ces, etc. and that obtd. from plants such as bromelin
papain, etc. can be used. As lactase that obtd. from
microbes of Saccharomyces, can be used.

Excellent butter flavour can be prepd. from inexpe
ive materials which are readily available. 6.12.77 as

Vibrating fluidised layer drying of friable material - using different temp. and velocity of drying agent when blowing through layer top and bottom
HEAT MASS TRANSFER (CONF=) 17.05.77-SU-484800
Q76 (23.09.78) F26b-03/08 F26b-17/24

The free flowing material vibrating fluidised layer drying method can be used in the confectionery industry. The method is carried out by blowing the drying agent through the material layer alternately from the top and the bottom. The drying agent used has variable velocity and temp.

To intensify the drying process, the ratio between the drying agents velocities is chosen depending on the layer height redn. of 20-40%, when blowing from the top, w.r.t. the layer height when blowing from the bottom. The drying agent temp. difference is 50-150°C.

Sheiiman, V.A., Lyuboshits, A.I., Kaplan, V.Ya. et al. Bul. 39/25.10.78. 17.5.77 as 484800 (2pp110)

Estimation of 2,4-di:chlorophenoxy-acetic acid herbicide in grain - by extraction with alcohol, treatment with lead acetate and chromatographic separation
SARAT FARM HYGIENE 01.12.76-SU-427921
J04 R16 (19.09.78) G01n-31/08

Determination of herbicidal 2,4-dichloro-phenoxy-acetic acid in grain cultures includes extraction with organic solvent, purificn. of extract and subsequent chromatographic analysis.

The accuracy of the determination is increased if fragmented grain is extd. with ethanol and extract is purified by treatment with aq. 10% lead acetate to ppte. the proteins. The extract is then treated at 60-65% with 1.5% alcoholic lead acetate to ppte. lipids. After filtration the herbicide is extd. with chloroform and sepd. by gas chromatography to determine the amt. of herbicide in grain tissue.

The removal of fats and proteins from organic extract using lead acetate reduces the error of qualitative determination of above herbicide in grain from 27% to 8%. Kiryukhina, N.N., Kolotusha, L.I. Bul. 39/25.10.78. 1.12.76 as 427921 (2pp938)

l element, which is easily handled, comprises an in-
nbustible jacket to contain the fuel and retain the ashes.
fibrous, porous jacket is made by felting glass fibres
a sheet which is then impregnated with a binder. The
ric is folded to form a tube and the sides are kept in
ition by clips; the ends are bent over and secured by
ther row of clips to keep the fuel in position. The lat-
consists of granulated wood charcoal treated with a
quetting liq. which acts as an igniting fluid. A suitable
is isododecane but paraffins with a flash point of the
ler of 60°C. can be used.
Two superimposed sheets of a non-porous, pliable
stic material, such as polyethylene, polypropylene,
yvinyl chloride or polyvinylidene chloride enclose the
ole assembly and are sealed together around the per-
ery on all four sides. Before final sealing, the enve-
e is evacuated in a chamber at a pressure of 5 mm of
rcury so that the igniting fluid remains uniformly dis-
buted throughout the fuel.

The element can be used more easily than the usual
wood chips or sawdust; the foodstuffs can be grilled or
smoked under better conditions. 4.11.77 as U33293 (7pp

Ultrahigh temperature heating system for liquids - in which liquid
from a steam heated curtain heater is pumped to a holder tube, e.g.
for pasteurising milk
CREPACO INC 08.09.78-US-940718
(24.07.79) A23c-03/02
Appts. for ultrahigh temp. treatment of liquid, e.g. milk to pasteurise it, comprises a vertical housing in which a falling curtain of the liquid, preheated to a first temp., is heated by a jet of steam. The resultant liquid/water/steam mixt. at a second temp. is pumped from the bottom of the housing, at a rate sufficient to prevent any build up in the housing, to a conventional holder tube where it is maintained for a desired period at the second temperature.

The pressure of pumping is such that all of the steam in the mixt. is condensed. Knowing the specific heat etc., of the liquid to be heated the flow rate of steam and liquid can be controlled to give the desired rise in temperature in the housing. When milk is being pasteurised it is preheated to 170°F and heated in the housing to 290°F.

D15: WATER TREATMENT

VEVG- ★ D15 58028B/32 ★BE -873-958
Anaerobic treatment plant for effluent - with circulation from digester to settling tank induced by methane gas rising in central column
VER VAN GEBRUIKERS 18.09.78-NL-009488 (06.02.78-NL-001345)
(06.08.79) C02c

Water-borne effluent is treated anaerobically in a vessel comprising a digestion chamber equipped with a feed for the effluent, above the digester, a pptn. chamber with a central opening and an inclined floor, a column rising through the central hole in the floor of the pptn. chamber which overflows into an annular space between the column and a sleeve, a gas collector and an overflow for clean water. The bottom of the central column is dished outwards so that the methane gas generated flows into the column and induces a circulation of liq. upwards through the column and over the overflow.

To ensure that effective sepn. of the gas from the liquid takes place in the annular zone, a flocculant is pref. added The water and sludge flow beneath the lower lip of the sleeve into the settling chamber. The floor of the chamber is pref. inclined down toward the central opening to ensure that the sludge flows out between the central column and the lower edge of the floor. For larger treatment plants where this may be impractical, the floor is equipped with a mechanical sludge scraper.

Due to the construction of the central rising column and the arrangement of the settling chamber and digestion chamber, short circuiting of the digestion and settling streams is avoided. By adjusting the vertical postion of the column, the throughput can also be regulated. 6.2.79 as 873958 (16pp1370) (F1)

Biological dry toilet with sepn. of urine from excrement - for evapn. of urine and composting of solid matter
ASKO-UPO OY 06.05.76-SF-001273
+P28 (15.05.79) A47k-11/02 C05f-03/06

Toilet comprises a box-shaped frame having on its top surface a toilet seat covered by a hinged lid. Within the frame is a composting space holding ⩾2 composting tanks which are rotatable about an axis offset from the vertical. In use one of the tanks has its opening beneath the hole beneath the toilet seat.

A separator comprises a flap and a follower. The flap is positioned beneath the seat. In the first position of the flap partially covers the hole whereas in its second position the follower pushes excrement into one of the composting tanks. In the first position the flap permits passage of urine to separate it from the excrement . The sepd. urine is collected in an evaporating basin.

The toilet separates at least part of the urine from excrement thus permitting the waste in the composting tank to come nearer to the optimum carbon/nitrogen ratio (about 35 to 1) for a composting process. 5.5.77 as 277740 (10pp295)

Dissolving sparingly soluble gas in liq. via siphon device - a
constriction to produce turbulent flow and form gas bubbles
BOC LTD 21.11.78-GB-045399 (12.09.77-GB-037979)
J02 (08.08.79) B01f-03/04 B01f-05

Appts. comprises a main vessel for contg. the liq., a reservoir, and a siphon for transferring liq. from the reservoir to the main vessel. A gas extn. pump is operable to avoid gas-locking the flow of liq. from the reservoir to the vessel. The gas is introduced into the liq. flow via a conduit connected to a leg of the siphon. A lift pump is provided for transferring liq. from the vessel to the reservoir.

Used for dissolving oxygen or oxygen-enriched air in water, e.g. sewage water. The gas supply conduit terminates in a constricted region of the siphon leg which creates turbulent flow. The region is provided upstream o a pair of chambers which are adapted to reduce the velocity of the liq. and provide a prolonged residence time for bubbles of gas in the liquid. The turbulence breaks the oxygen into relatively small bubbles. 21.11.78 as 045399 (5pp1044)

Control valve for water carbonating appts. - to exhaust carbon
di:oxide and prevent backflow to supply water, has fail/safe action
SCHWEPPES LTD 17.01.79-GB-001751 (22.10.77-GB-044051)
(08.08.79) B01f-03/04

Appts. comprises a pump arranged to supply water to a carbonating vessel through a valve having two operationa positions. One of the positions permits flow of water to the vessel and the other position permits exhausting of CO_2 from the vessel to the valve. When the pressure at the pump output deviates from an operating pressure by a pre-set amt. a sensor causes changing of the valve from one position to the other.

Used in post-mix beverage dispensing system. The valve is changed to the second position in response to failure of the electrical supply, low pressure in the liq. flow line and the level of water in the carbonating vessel. Venting of the backflowing CO_2 prevents the CO_2 from coming into contact with the supply water. 17.1.79 as 001751 (7pp1044)

Inhibiting corrosion of non-ferrous metal in water system - by
adding ferrous sulphate and organic polymer to the water
FOSPUR LTD 07.12.78-GB-047531 (28.01.78-GB-003530)
A97 E31 M14 (08.08.79) C23f-11/18

Corrosion is inhibited by adding to the water a soln. of a mixt. of ferrous sulphate and an organic polymer in sufficient quantity to deposit an even layer of ferric hydroxide on the non-ferrous metal.

A mixt. comprising ferrous sulphate, an organic polymer, and a reducing agent for ferric ions or a chelating agent for ferric or ferrous ions is also claimed.

The mixt. comprises 60-99% $FeSO_4$ and 1-40% organic polymer, e.g. a cellulose ther, substd. cellulose ether, natural starch or gum, polysaccharide or substd. polysaccharide. The mixt. may contain a flow assisting agent, e.g. calcium or magnesium silicate, pptd. silica or a mixt. of $CaCO_3$ and calcium stearate. The mixt. is added to the water at 0.2-25 parts per million by wt.

Used for cooling systems, e.g. of a steam generating plant, partic. non-ferrous metal condensers. 7.12.78 as 047531 (3pp1302)

Sterilising water e.g. for swimming pool - by passing through filtering appts. contg. mixt. of diatomaceous earth and silver cpd.

AQUEONIX INC 01.12.77-JA-143338

Q46 (26.06.79) C02b-03/10 E04h-03/20

Water prior to feeding to a swimming pool is passed through a filtering appts. contg. a mixt. of diatomaceous earth and Ag cpd. generating Ag ions.

Filtering material is produced by coating the pulverised diatomaceous earth or river sand with the Ag cpd. at 600-800°C. 1.12.77 as 143338 (3pp15)

OSHI- ★ D15 58640B/32 ★J5 4079-950

Construction filling material mfr. - from waste cake generated in a cleaning bed, by mixing with soil, calcium chloride, blast furnace slag etc., and curing

OSHIO SANGYO KK 08.12.77-JA-146592

(26.06.79) C02c-03

The filling material is produced by adding 3-7, pref. 5 wt. parts of a remaining soil to 10 wt. parts of the waste cake; thoroughly mixing the mixt. in a mixer capable of carrying-out simultaneous revolution and rotation; adding 0.5-1 wt. part of a treating agent prepd. by adding 3-10 wt.%, pref. 5 wt.% of $CaCl_2$ to a blast furnace cement, based on 10 wt. parts of the mixt.; and subsequently curing the mixt. for $\geqslant$ 24 hrs.

In an example, 0.5 m^3 of the wasted cake and 0.5 m^3 of the remaining soil (Kanto loam) are mixed together for 5 mins. in a mixer capable of carrying-out simultaneously rotation and revolution, after which 100 kgs. of the treating agent comprising 95 kgs. of blast furnace slag and 5 kgs. of $CaCl_2$ is added thereto, followed by mixing together for about 5 mins. and curing for 3 days to give a filling material. 8.12.77 as 146592 (3pp34)

KIKU/ ★ D15 58641B/32 ★J5 4079-951

Polymer coagulant for treating sludge from cleaning bed - comprises e.g. sodium polyacrylate which is mixed with sludge and the mixt. filtered and dewatered

KIKUCHI K 09.12.77-JA-147182

A97 (26.06.79) B01d-21/ C02c-01/40 C02c-05/02*

A sludge resulted in cleaning bed is treated in low maintenance and installation cost and in simple procedure by mixing it with a polymer coagulant, e.g. Na polyacrylate, followed by subjecting to filtration and dewatering treatments.

In an example, a sludge is transferred from a sludge pond to a thickener via a pump, and further sent to a reaction vessel via a pump. Into the reaction vessel is charged a coagulant, e.g. Na polyacrylate etc. from a polymer coagulant-dissolving vessel via a pump. The sludge and the coagulant are thoroughly agitated together in the reaction vessel by means of a motor and sent to a filter, e.g. a rotary filter or micro-strainer etc. to separate it into a water component which is recirculated to the sludge pond and a cake which is dried by the sun light for about one month to lower its water content to 40-60% and discarded. 9.12.77 as 147182 (2pp34)

Appts. for treating cyanide gas and water obtd. in electropolishing - has absorption column for cyanide gas and cyanide cracking tower for aq. cyanide soln. using UV rays
YAMANASHIKEN 12.12.77-JA-149047
E36 J01 M11 (28.06.79) C02c-05/04 C25f-03

An electropolishing means is set on a platter in an electro-polishing and washing chamber. When it is begun to electropolishin a noble metal, a cyanide gas is produced from a warmed electrolyte and is introduced a gas channel into a cyanide adsorbing chamber to adsorb the cyanide in a filter material. A circulating water is supplied from a water tank through a pump, into a shower nozzle, and returned through a hole of a cyanide chamber bottom into the water tank. The purified gas is discharged through a blower to the atmos.

After electropolished, the polished noble metal is washed with water in the electropolishing and washing chamber, so that the cyanide is mixed in the washing water. The water contg. the cyanide is sprayed under pressure from a shower nozzle into a cyanide cracking tower to decompose the cyanide with UV rays so as to produced purified water.

The cyanide gas and water produced in the electropolishing may be easily treated to prevent air and water pollution. 12.12.77 as 149047 (3pp35)

NIRA ★ D15 58903B/32 ★J5 4081-183
Hydrophilic heavy metal adsorbent esp. for mercury - produced by reacting cyanuryl chloride, thio:carbo:hydrazide and an amino-sulphonic acid, and reacting with a poly:isocyanate
UNITIKA KK 12.12.77-JA-149567
A91 J01 M25 (28.06.79) B01d-15 B01j-01/08 C08g-73/04

A heavy metal ion adsorbent which is highly hydrophilic and shows excellent selective adsorption ability to heavy metal ions is produced by mixing polyisocyanate with a reaction prod. obtd. from cyanuryl chloride, thio carbohydrazide (at the molar ratio cyanuryl chloride: thiocarbohydrazide of 1:1-3) and an aminosulphonic acid (or its salt) of formula $H-NR_2-R_1-SO_3M$ (where R_1: aliphatic or aromatic 2-12C divalent organic radical R_2 is H or aliphatic monovalent organic radical of C_1-C_2; M is H, alkali metal, or tert-organic base) in a polar non-proton solvent (the permittivity of $\geqslant 30$) and hardening the resulting mixt.

This adsorbent is esp. useful for adsorbing Hg from industrial waste water, and the running cost for regenerating the resin can be greatly reduced because this is very stable against strong acids. 12.12.77 as 149567(10pp55)

NIRA ★ D15 58904B/32 ★J5 4081-184
Highly selective adsorbent for metal recovery from soln. - is obtd. by forming crosslink in polyethyleneimine by epi:bromohydrin in an aq. soln. in presence of soluble metal salt
UNITIKA KK 12.12.77-JA-149568
A91 J01 M25 (28.06.79) B01d-15 B01j-01/08 C08g-73/08

The adsorbent is produced by forming crosslink in polyethyleneimine (where 10-70% of the H atoms directly linked with N atoms are modified with carboxymethyl gp. and its molecular wt. is $\geqslant 10000$) by epibromhydrin in an aq. soln. in the presence of a soluble metal salt.

The adsorbent is pale yellow after metals are eluted, thus in the case of coloured metal complexes, the elution can be seen. After the elution is over, the adsorbent can be used for adsorbing treatment either as carboxyl type after it is sufficiently washed with water, or as alkali metal salt type after it is treated with an alkali. The adsorbent is used for sepg. specific metals from an aq. soln. contg. several kinds of metal ions. On an example, sepn. of Ca^{2+}, Mg^{2+}, from the sea water, recovering Ag, Al^{3+}, Ni^{2+}, Co^{2+}, Cr^{3+}, etc. from the metal plating waste water, etc. 12.12.77 as 149568(6pp55)

NREN ★ D15 58905B/32 ★J5 4081-185
Regenerating ion exchange resin in a fixed bed - includes downwardly passing regenerant through resin layer and then upwardly passing fresh regenerant through resin
NIHON RENSUI KK 12.12.77-JA-149010
J01 (28.06.79) B01j-01/09

Regeneration reagent is divided into portions and one part the waste liq. is withdrawn from the bottom. The rest of the reagent is led upwardly through the resin layer from the bottom and after it is retained, waste liq. is taken from the bottom.

This process can be applied to any ion-exchange resin but is esp. advantageous for resins which change their volume greatly on regeneration, such as weak basic anion exchange resin. Compared with conventional methods, less regeneration reagent is used and efficiency is improved. 12.12.77 as 149010(5pp55)

MORI/ ★ D15 59033B/32 ★J5 4081-564

Filtering waste water - using a filter cylinder mfd. by partially fusing small particles of polyolefin, and shaping into a cylinder

MORI M 09.12.77-JA-147877
A88 J01 (29.06.79) B01d-39/16

A filter cylinder is fabricated by partially fusing very small particles of polyolefin resin to each other and forming the particles into a cylinder. Polluted water is produced by condensation of waste water. The polluted water is filtered through the filter cylinder under the condition that the pressure difference is not generated between the inner and outer walls of the filter cylinder. In this manner, clean water is obtd.

This filter cylinder has high mechanical strength and excellent resistance to chemicals.

Very small particles of polyethylene, polypropylene or an ethylene-propylene copolymer having a grain size of 10 to 900 µ can be used. The particles are packed into a mould and partially fused to each other at a temp. slightly higher than the m.pt. of the resin to fabricate a filter cylinder. The filter cylinder has a pore dia. of 30-100 µ. 9.12.77 as 147877(4pp86)

ASAH ★ D15 59035B/32 ★J5 4081-663

Water purificn. appts. suitable for domestic use - comprises absorption layers of activated charcoal, ion exchange resin, chelating resin, zeolite etc. and semipermeable membrane

ASAHI CHEMICAL IND KK 13.12.77-JA-149537
(29.06.79) C02b-01/14

The water purifying appts. comprises in succession an absorbing layer composed of activated charcoal, ion-exchange resin, chelating resin and zeolite etc. in which the unwanted substances, e.g. Cl_2, Na^+, K^+, Mg^{2+}, Fe^{2+}, bleaching powder, etc. are removed by absorption, and a semi-permeable members layer having the holes dia. of 1 mµ to 0.5 µ, pref. 2 mµ to 0.45 µ, through which bacteria and polymer cannot pass. The semi-permeable membrane layer may be composed of a bundle of hollow fibres of semi-permeable membrane.

A water purifying appts. suitable for domestic use, removes substances with undesired odour or taste, e.g. very small amt. of organic matters and hard components to give water of high quality and free of bacteria over a long period. Further no proliferation of bacteria takes place in the appts. even in a long period of non-use as the absorbing layer is maintained in a sterilised state. 13.12.77 as 149537 (6pp34)

MITSUBISHI HEAVY IND KK 10.08.76-JA-094495
*J01 (13.07.79) *J53019-970 B01d-53/34 C02c-05*

Waste gas is treated in a wet process by contacting for concn. a waste gas with a soln. contg. impurities discharged from the treatment system, while maintaining pH of soln. at 1-4, and heating for drying the concentrated soln. to draw out the impurities in a form of solid, to thereby effect the treatment with no waste liq. produced.

Waste effluent from absorption and post treatment steps is recycled in a concn. tower to contact waste gas while supplying it with alkali soln. like lime slurry to maintain it at pH 1-4, to prevent evapn. of Cl^- out of the recycling waste effluent and to suppress absorption of SO_x in waste gas. The waste gas from the concn. tower was introduced to absorbing tower via cooling tower, while the recycling soln. partly is supplied to evapn. and drying process to recover salts and dusts in solid form and to recycle the distilled liq.

The process treats waste gas without addn. of equipment for treatment of waste water with high COD usually by-produced in wet processes of waste gas treatment. 10.8.76 as 094495 B01d-53/34; C02c-5/00 (13.7.79) MITSUBISHI HEAVY IND KK (10pp) (J5 3019970)

Drain water sampling in proportion to flow volume - using compartmented paddle wheel scoops spread in depth below surface
NONFER METAL ORES 13.04.76-SU-347841
J04 R16 (25.09.78) G01n-01/10

The proposed appts. is suitable for sampling running waste water in open drains or channels, and to deliver a sample in unit time proportional to the flow, i.e. depth or height of water level.

The sampler takes the form of a paddle wheel on a fixed hollow shaft, the wheel carrying a number of scoops designed to deliver into a hollow tube forming the wheel rim and then into hollow spokes leading to the hub. The feature of the scoops is their division into radially tiered compartments all delivering the trapped water into the receiving tube. Each compartment strikes the water at a different level, hence the amount of water taken up depends on the height of the surface.

Non-lethal dNA virus derivs. - produced by eliminating lethal genes not essential for integration
UNIV LIBRE BRUXELLE 23.03.79-BE-875073
B04 (16.07.79) C12k

New DNA virus derivs. and their prodn. and use are claimed. The virus derivs ('mini-viruses') include the integration sites and functions of the parent virus from which they are derived, so that they are still capable of integrating at any site in the genom of their host, but lack the lethal genes not essential for integration.

The derivs. are produced by (a) eliminating from the genom of a DNA virus a part of a transposable element capable of entraining with it at least a fragment of the viral DNA adjacent to it, the transposable element being localised in the viral genom at a site such that, when it is eliminated, all of the nonessential lethal genes are entrained simultaneously, (b) isolating strains of the host in which the part of the transposable element has been eliminated from the virus, and (c) identifying and isolating the strains in which the virus deriv. contains only those genes essential for integration.

The virus derivs. can be used to induce mutations and chromosomal rearrangements with a high frequency without being lethal to the host. 23.3.79 as 875073 (26pp367)

emp. aseptic maceration of grapes to make red wine - by ensive batch process suited to small scale prodn.

AL M J F 07.11.77-FR-034063 (08.01.71-FR-001704)
(06.07.79) C12g-01/02

nstallation for treating grapes prior to the fermenta- tage, comprises two, thermally insulated vessels of The vessels are used alternately for the maceration of successive batches of drained grapes. Maceration includes soaking a batch in preheated wine to achieve a batch temp. of about 50°C., for about 10 minutes. The wine is recycled and the grapes, after maceration, are immediately transferred to a press for extn. of juice to be fermented.

Each vessel is pref. fitted with a top cover which is refrigerated to condense and return alcoholic vapours. The cover pref. incorporates an under-pressure relief trap and a restricted vent to atmos. which is cooled to minimise loss of vapour. The relief trap is pref. a counter balanced, hinged, trap door. Wine is pref. circulated through a thermostatically controlled heat exchanger and can be directed automatically via either batch vessel or to a storage tank.

The process simultaneously provides a low temp. aseptic treatment which ensures retention of pectolytic enzymes vital to clarification of the prod. The required asepsis is achieved without using, or with very little, sulphur dioxide. The installation is simple and inexpensive to a degree which makes it attractive to small and medium-sized wine producers who could not justify the investment necessary for the continuous plant. 7.11.77 as 034063 (14pp448).

MOMD D16 66864Y/38 #GB 1549-959

Nutritious medium for fodder yeast mfd. from manure, etc. - by hydrolysing conc. suspension and adding back decanted liq. fraction

MOSCOW MEAT DAIRY INST (MOME=) 15.03.77-BE-852465 (24.08.77-GB-035411)
*+P11 (D12 D15) (08.08.79) *BE-852-465 C12b-03/08*

Prepn.of a nutrient medium for cultivating microorganisms comprises (i) sepg. liq. manure into a conc. suspension and a liq. fraction, (ii) hydrolysing the suspension by heting under a pressure greater than atmospheric in the presence of a mineral acid as catalyst, (iii) sterilising the liq. fraction, (iv) mixing the hydrolysate with the liq. fraction, (v) adjusting the pH of the mixt., (vi) irradiating the mixt. to destroy yeast toxins and (vii) cooling the prod.

Pref. sludge is sepd. from the mixt. of hydrolysate and sterilised liq. fraction. The process provides an improved efficiency as regards use of manure in that organic and mineral cpds. contained in both the suspension and liq. fraction, are retained for use in the growth of fodder yeast. 24.8.77 as 035411 (8pp924)

Insoluble protein esp. enzume, compsn. - on microporous dispersions of filler particles in a binding agent

AMERACE CORP 29.08.75-US-609077
*A96 B04 (A97) (08.08.79) *DT2639-234 C07g-07*

An insoluble composite is prepd. comprising a microporous member which comprises a binder and ≥2 finely-divided filler particles dispersed throughout the binder, and a proteinaceous substance bound to ≥ some of the filler particles.

Pref. the microporous member comprises a network of interconnected micropores having size distribution of 0.01-100 microns as determined porosimetrically by the mercury intrusion method. Filler particles comprise ≥25 wt.% of microporous member, and comprise silicious material. Binder comprises PVC or hard rubber. Proteinaceous substance is glucose oxidase, aldose-1-epimerase-alpha-D-fructofurananosidase, alcohol, dehydrogenase or glucose isomerase.

The insoluble composite is esp. used as a means for immobilising enzymes by coupling or bonding. 17.8.76 as 034237 (14pp931)

KAPA D16 41979Y/24 =GB 1550-151

Immobilising enzymes or microbial cells - in photohardening resin contg. photopolymerisable ethylenically unsatd. gps. and ionic hydrophilic gps.

KANSAI PAINT KK 26.11.75-JA-140840
*A97 B04 (08.08.79) *DT2629-693 C07g-07/02*

Enzymes or microbial cells are immobilised by uniformly mixing an aq. dispersion of enzymes or cells with a photocurable resin of average mol. wt. of 300-30,000 having ≥2 photopolymerisable ethylenically unsatd. gps. per mol. and having ionic hydrophilic gps. The mixt. is then irradiated with actinic radiation.

Pref. the enzymes are urease, glucose oxidase, catalase, glucoamylase, glycose, isomerase, invertase, glucose oxidase-catalase, lactase, D-amino acid oxidase, alpha-galactosidase, aminoacylase, aspartase or penicillin amidase. Cells are Lactobacillus bulgaricus, Aerobactes aerogenes, Bacillus subtilis, Azotobacter vinelandii or Proteus vulgaris.

The immobilised enzymes or cells used can be shaped into any desired configuration and have no toxicity. 30.6.76 as 027333 (6pp931)

SNAM D16 04317Y/03 =GB 1550-153
Improving oxidoreductase enzyme activity - by incorporating to fibrous structure with coenzyme preliminarily bonded to water soluble polymer BE100177)
SNAMPROGETTI SPA 10.07.75-IT-025251
*A96 B04 R16 (08.08.79) *DT2631-045 C07c-101/08 C07g-07/02 C07j-01 C07j-05*

An enzymatically active structure is prepd. which comprises ≥1 oxidoreductase enzyme, and ≥1 coenzyme which is an adenine deriv. where 1 H of the 6-amino gp. of the adenine ring system is substd. by a substd. alkyl gp. of formula $-CH_2CHOH(CH_2)_nCOX$.

In the formula, X is an amino gp. which forms a pt. of a water soluble polymer; n is 1-4. The enzyme(s) and coenzym(s) are distributed throughout a body of water insoluble polymeric encasing material. The distribution is such that the enzyme(s) and coenzyme(s) are retained in the body so that on contact with a reaction medium are capable of effecting or assisting respectively the enzymatic reaction to which the medium is subjected.

Oxidoreductase susts. prepd. have improved activity. Enzyme-carrying supports can be easily separated from the reaction mixt. and reused. 8.7.76 as 028526 Add. to 1510894; 1510534 (5pp931)

Methane prodn. from wastes - by anaerobic digestion of liq. fraction
NEWALL P J 29.12.77-EI-002633
E17 H09 (08.08.79) C02c-01/14

Prodn. of methane from waste prods. (esp. animal slurries) is carried out by (a) holding the slurry for a time long enough to allow fermentation and conversion of the organic fraction to volatile acids; (b) sepg. a liq. fraction contg. the volatile acids from a solids fraction; and (c) feeding the liq. fraction into an anaerobic methane digester contg. a bacteria-holding matrix.

The slurry (e.g. from an intensive pig-rearing unit) is fed into a holding-settling tank, where it is kept for the required residence time. The supernatant liq. is then fed via a series of perforated pipes into the base of an aerobic filter, e.g. packed with limestone pebbles or gravel supported by a perforated plate. The liq. percolates through the filter at a temp. of 25-35°C. and a pH of 6.8-7.4.

The process can be operated with short residence times (≤ 1 day) using wastes with a strength of up to 20,000 mg./l. (as acetic acid). 20.12.78 as 049354

Calcium-contg. compost prodn. - by culturing aerophilic bacteria
mixt. of sponge-like calcareous porous material and compost
NAGATA T 22.11.77-JA-140261
C04 (27.06.79) A01n-15 A23k-01/17 C05b-17 C05f-09/04

Calcium compost is obtd. by culturing aerophilic bacteri
in a mixt. of a sponge-like calcareous porous body and
compost material (vegetable organic material). The spon-
ge-like porous body may be e.g. blast furnace slag, con-
verter slag, coral reef, coral sand, bone powder, etc.
The wt. ratio of the porous body to the vegetable organic
material is 2 : 98-98 : 2. As aerophilic bacteria there ar
used, e.g. Nitrosomonas, Azobacter, etc. Fermentation
is at 15-75°C, pH 4-10, humidity 60-70% and in the shad

The smell is removed due to the heat generated durin
fermentation, even if excrements of human beings, sludg
and excrements of domestic animal are used. The prod.
has moderate humidity and particle size, and does not
create dust.

The prod. can be used as feedstuff for domestic anim-
als and cultivated fish. When it is fed to hens, occurrenc-
es of diseases can be reduced and the thickness of the eg
shell is increased. Similarly occurences of diseases are
reduced in the case of fish. By applying the prod. to soil,
high calcium content plants are produced. It improves th
physical property of soil for long periods and neutralises
the acidic soil for long periods. 22.11.77 as 140261 (10p

Granular compost for paddy rice, wheat, vegetable etc. - produce
by mixing waste fibres from paper mfr. with coagulated wast
precipitate from a pulp factory, and fermenting
KURIHARA K 08.12.77-JA-147621
C04 F09 (27.06.79) C05f-07

The compost is obtd. by mixing waste fibres from a pape
-mfg. factory with the coagulated ppte. from a pulp-mfg.
factory, and fermenting the mixt. in a fermenter. The
fermenter also acts as a granulating aid.

In an example, 100 kg of waste fibres from a paper-mfg. factory, .5 kg of diammonium hydrogenphosphate, 30
kg of coagulated ppte. from kraft-pulp waste liq. and 10 kg
or iron-mfg. blast furnace slag are mixed, and put in an
inclined rotary fermenter. The temp. is adjusted to 40°C,
and water content is adjusted to about 65%. The rotary
fermenter is operated at 5 r.p.m. After 2 hrs., the fermented prod. is removed. The recovery percentage of the
compost is 87%. The compost has an average size of 5 mn
with a water content of about 45%, and has a smooth surface.

The fertiliser is suitable for soil-conditioning and cultivation of crops, and is easily handled. The compost is
applied to e.g., paddy rice, wheat, flowering grasses and
vegetables. 8.12.77 as 147621 (3pp108)

Thermally sensitive material dryer - has gas distribution grid and wick made as flexible threads

HEAT MASS TRANSFER 11.05.77-SU-485186

Q76 (23.09.78) F26b-05/16 F26b-17/10

The dryer can be used for thermally sensitive material, e.g. microbiological pastes, and dryer contains a fluidised bed chamber with a gas distribution grid and capillary porous wick.

In order to intensify the drying process and to prevent grid blocking, the wick is made as flexible threads attached at one end to the grid. The other end of the threads is connected to the chamber upper covering. The grid is covered by a thread like layer which is submerged in the fluidised material layer. The fluidised layer is made homogeneous due to the flexible threads.

Kuts, P.S., Karpov, A.M., Bogdanov, V.M. et al. Bul. 39/25. 10. 78. 11. 5. 77 as 485186 (2pp110)

Alcoholic fermentation of starch-contg. base - includes sepn. of gas and liquid phases during a secondary fermentation stage for recirculation

FERMENT PRODUCT RES 15.05.77-SU-497963

(13.09.78) C12c-11/08

Starch-contg. base is fermented by a process comprising (a) supplying nutrient medium and a yeast seed culture to a fermenter, (b) fermenting the mixt. in the presence of fermentation gasses for 40-48 hrs., (c) drawing off from the fermenter a gas-liquid emulsion contg. 1-2% dry wt. solids, (d) separating the emulsion into gas and liquid phases during a secondary fermentation stage, and (e)drawing off gas-liquid emulsion for every successive secondary fermentation stage and supplying it to the liquid layer from the preceding stage, maintaining the liquid level above the level of the liquid phase in the fermenter.

The method enables the entire fermentation to be carried out in sterile conditions and minimises prod. losses.

*B04 (24.07.79) *J53121-701 +A61k-35*

Novel antibacterial cpd., XK-99, is characterised by (a) a mol. wt. of 390, (b) m. pt. ~ 250 °C (decomposition), (c) $(a)_{o}^{24}$ = -360° (C = 0. 1, methanol), (d) an elemental analysis of 58. 24%C, 4. 57% H and 9. 89% N, characteristic UV and IR spectra are given.

XK-99 is produced by culturing a microorganism Micromonospora melanosporea subsp. komaensis NRRL 11, 100 in a nutrient medium. Pref. culturing is at 25-40 C at a neutral pH for 4-7 days.

The cpd. is, however, toxic and so is used as a topical antibacterial agent for cleaning and sterilising laboratory glassware and surgical instruments and may also be used with soaps, detergents, etc. for sanitation purposes. 29. 3. 78 as 891263 (8pp992).

Copper chromium oxide hydrogenation catalysts - for coconut oil, tallow and related esters
KAO SOAP KK 02.02.73-JA-013471
*J04 (02.08.79) *DT2404-757 B01j-23/86*

A Cu-Cr catalyst is prepd. by dissolving 0.5-3 mol. CrO_3 in water, adding 1 mol. CuO to the aq. soln. obtd. and then adding a reducing agent quantity corresponding to 0.1-1 mol. HCHO. The reducing agent is a cpd. which can be oxidised to CO_2 and water and causes the reduction of the Cr^{6+} of the unreacted CrO_3 to Cr^{3+}. After adding 0.9-8 mol NH_3, the reaction mixt. obtd. is evaporated to dryness and calcined 10 min. to 3 hrs. at 250-650 °C.

The catalyst can be used in the high pressure hydrogenation of coconut oil, beef tallow or their Me esters; has high activity, causes no environmental pollution in use, is easily filtered, causes no discolouration of the higher alcohols obtd. and does not corrode high pressure plant used. 1.2.74 as 404757 (4pp200)

Pulp prodn. from plant fibre raw materials - by hydrolysis to extract hemi-cellulose before decomposition with solvent and lignin dissolution
KNAUTH H 27.01.78-DT-803465
F09 (02.08.79) C13k-13 D21c-03/20

In pulp prodn. by vegetable fibre raw material decomposition with organic solvents, the hemi-celluloses and other extractable raw materials are extracted during a pretreatment step, so that in subsequent decomposition with organic solvent, the waste liquor contains, almost exclusively, dissolved lignin.

Pulp quality- and sugar yields are high. All raw materials can be used. Preliminiary separation of sugar components and acids allows the use of high-boiling solvents for decomposition. Process pressure and hazards are smaller. 27.1.78 as 803465(9pp200)

Hides liquid finishing treatment drum - has shelves with variable width flanges narrowing from bottom to centre to promote fluid circulation
UKR LEATHER SHOE 08.10.75-SU-179223
(03.10.78) C14c-15

The treatment of hides or leather is ensured by variable width flanges of flight decreasing from the bottom of the cylinder to the centre. This promotes the shift of the treated material laying on the flange in all levels of the fluid.

After the loading of the hide and following the fill of working fluid, the drum is rotated with two pockets formed between the flight, variable height base and inner surface of the drum. The variable width slots promote fluid entry into the pockets from two sides.

sample purifying tower, giving improved response
MITSUBISHI ELECTRIC CORP 13.12.77-JA-149592
J01 (28.06.79) B01d-53/14

An offensively smelling gas is introduced through a
into a prim. purifying tower and a sample purifyin
which is disposed parallel to the primary purifying
so that it is simultaneously purified and deodorised
two towers. The concn. of the chemical liq. in the
le purifying tower is detected by a detector and a
al liq. injecting pump is automatically controlled t
a regulator with the detected signal.

This plant permits for the presponse and the pre
to be considerably improved in the chemical injecti
trol system, so that the chemical liq. in the tower
may be always maintained at the constant conc. to
ise the offensive smell gas efficiently and stably. 1

*A96 P34 +P32 P73 (24.07.79) *DT2802-295 A61f-13*

A synthetic membrane or skin is prepd. contg. polyamino
acids usable for wound-dressings contg. 2 integral layers
≥1 layer being resorbable by the body.

The first internal layer is directly applied to the wound and the second layer constitutes an external protection. The second layer is formed from a porous semi-permeable membrane or film having an asymmetric structure, having pores of decreasing size when going from the inside to the outside layer. This structure ensures the free penetration of air, water and low mol. wt. substances, but prevents the entrance of external pathogenic germs. The first layer is formed of a hydrophilic, non-toxic, biodegradable membrane or tissue consisting of a pluricellular, spongy and fluid permeable material which is a polymer or copolymer of alpha-amino acids or their ester

This prod. has the property of improving the healing capacity of the living tissues. 16.1.78 as 869688 (7pp931)

Rotary cage continuous press to extract oil from seeds, etc. - has power driven crushing wheel inside frictionally driven eccentric cage

IND CHIM ITALIA 04.01.79-IT-047519 (06.04.78-IT-048783)
(31.07.79) A23n

The press comprises a power driven, heavy pressing wheel which is rotated on its axis inside an annular, extraction cage. The cage is internally channeled with an annular track in which the rim of the wheel slides with a slight clearance. The axis of the wheel is parallel and eccentric to the axis of the cage. The cage is freely rotatable within a ring of freely rotatable, radial support rollers. The periphery of the wheel just clears the internal circumference of the annular track at its closest point. The cage can be rotated on its axis by frictional drive transmitted from the wheel to the channel via sandwiched material being pressed

Extracted oil outlet holes are pref. formed through the base and sides of the track in the cage. An inlet for material to be pressed is pref. formed into the zone of max. clearance between wheel and cage.

Used for prodn. of oil from soft oil seeds and fruits, such as grape stones, cupra, olives etc. together with simultaneous output of drained cake suitable for pelletising. This robust, simple machine applies progressively increasing pressure up to a max. Highly efficient pressing action is obtd. by two eccentric rolling elements with frictional drive coupling. 5.4.79 as 875360 (23pp448)

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will

COUNTRY CODES

For patent number (not priority) purposes, DS distinguis accepted West German specifications (DAS) from unexamined applications (OLS) which are given the nor DT code. in the case of Japan J5 represents unexamined applications, and J7 the examined of present series.
